Ammonia In Baking Powders.

Among the recent discoveries in science and chemistry, none is more important than the uses to which common ammonia can be properly put as a leavening agent and which indicate that this familiar salt is hereafter to perform an active part in the preparation of our daily food. The carbonate of ammonia is

exceedingly volatile substance. Place a small portion of it upon a knife and hold over a flame, and it will almost immediately be entirely developed in to gas and pass off into the air gas thus formed is a simple composition of nitrogen and hydrogen. No residue is left from the ammonia. This gives it its superiority as a leavening power over soda and cream of tartar used alone, and has induced its use as a supplement to these articles A small quantity of ammonia in the dough is effective in producing bread that will be lighter, sweeter and more wholesome than that risen by any other leavening a rent. When it is acted upon by the heat of baking, the leavening gas that raises the dough is liberated. In this act it uses itself up as it were; leaving no trace or resi duum whatever. The light, fluffv. recommend him for first place on the flaky appearance, so desirable in bisenits, etc., and so sought after by professional cooks, is said to be imparted to them only by the use of this agent The bakers and baking powder goods have been quick to avail themselves of this useful discovery, and the handsomest and best bread and cake are now largely risen by the aid

> of ammonia combined, of course, with other leavening material. Ammonia is one of the best known products of the laboratory.
