### MAINTAINING GOOD ROADS.

Right Use of the Roller Will Greatly Lessen the Work.

The proper repair of earth roads becomes an important matter at this season. An authority on roadmaking lays great stress upon the use of the rollers. The earth is composed of small fragments which touch each other at certain points, leaving voids between. Where earth is broken and pulverized these points are equal in volume to the solid particles, and as a result the earth will absorb almost an equal portion of water.

In building or maintaining roads it is therefore desirable that these small particles be pressed and packed into as small a space as possible in order that surplus water may not pass in and destroy the stability of the road. To this end rolling is very beneficial. The work of making earth roads is greatly lessened by the proper use of the roller.

After additional matter has been placed on the surface of the road it should be carefully rolled and not allowed to wash off into the ditch. If the earth is left loose wheels will cut in and roll in ridges and furrows, which will hold water and result in a sticky, muddy surface in winter weather and a dusty one in dry weather. If the surface is given over with a heavy roller it can usually be made sufficiently firm to sustain teams without deep rutting and to resist in a large measure the penetrating power of the water. Such work should be done when the soil is in a plastic state, so that it will pack readily. The most particles are pressed together, and the road is put in good condition for immediate travel.

### ROLLED ROAD OF SMOOTH, FIRM SURFACE.

These points are equal in volume to the solid particles, and as a result the earth will absorb almost an equal portion of water.

In building or maintaining roads it is therefore desirable that these small particles be pressed and packed into as small a space as possible in order that surplus water may not pass in and destroy the stability of the road. To this end rolling is very beneficial. The work of making earth roads is greatly lessened by the proper use of the roller.

After additional matter has been placed on the surface of the road it should be carefully rolled and not allowed to wash off into the ditch. If the earth is left loose wheels will cut in and roll in ridges and furrows, which will hold water and result in a sticky, muddy surface in winter weather and a dusty one in dry weather. If the surface is given over with a heavy roller it can usually be made sufficiently firm to sustain teams without deep rutting and to resist in a large measure the penetrating power of the water. Such work should be done when the soil is in a plastic state, so that it will pack readily. The most particles are pressed together, and the road is put in good condition for immediate travel.

### UNROLLED ROAD; LOOSE, SOFT SURFACE.

The surface is given over with a heavy roller it can usually be made sufficiently firm to sustain teams without deep rutting and to resist in a large measure the penetrating power of the water. Such work should be done when the soil is in a plastic state, so that it will pack readily. The most particles are pressed together, and the road is put in good condition for immediate travel.

### A GOOD ROADS ARGUMENT.

What the Good Road Saves in Horse-Rent, Time and Breakage.

Local papers printed near New York often contain items like the following: "John Smith, our popular truckman, has abandoned his trucking business for the summer and taken his horses to the Hudson river, where there is twice the money to be made hauling farmers' wagons up the hill or over the swamps." The facts are that hundreds of farm wagons travel every night on the roads of New York. They are loaded down with sweet corn, tomatoes, lima beans and similar perishable goods. Parts of the road are smooth and hard, other portions are soft or stony and steep. The size of the load is determined by the firm, level places in the road, not by the firm, level places. Two horses may be able to haul a load worth \$20 over a smooth road, while the same team would struggle to haul \$30 worth over the worst places. This might not make so much difference with crops like hay, grain and potatoes, for they can usually be held until the roads are at their best. The green produce cannot wait. It must be hauled when it is ready or be wasted. Thus, even though the stretch of bad roads covers only 5 per cent of the total distance, the farmer must keep an extra horse, leave part of his load behind or lose some one to help him over the bad places. Dozens of men with teams find great profit in doing the work, sometimes earning half a dollar for a few hundred feet of hauling. We have known farmers ride the figures given to show the cost of bad roads. That is because they do not realize what the good road would save in horse-drawn, time and breakage—Rural New Yorker.

### A Corn Husking Trick.

A corn husking rack shown in American Agriculturist is easily built of a few sticks. It can be made of any size desired, but a convenient one is eighteen inches high, three feet wide and six feet long. The common method of using it is to tip it over against one side of the shock, which is then pulled over on to the rack. The shock is unbound and is then ready for one or two huskers.

**High Pressure Dairying.**  
 The tendency is somewhat toward high pressure dairying in regions where the milk market is unlimited and pastures scanty. Under certain conditions it may pay better to wear a cow out quickly and buy another rather than to continue her through a long or time at a lower rate of production. The plan is somewhat different from the old time dairymen, who likes to see his cattle living in a more natural manner and remaining with him year after year. But this is a high pressure and wears out animals and men alike with its hard but fascinating pace, remarks American Cultivator.

### CELERY FOR MARKET.

In removing celery plants from storage they should be cut off a little before the ground, using for that purpose a sharp knife. Some growers pull the whole plant up, but this is not necessary. The celery is not so apt to become dirty when the roots are cut off, and the plants can be more easily handled. The roots will do no damage in the sand or soil, as it must be removed and a new layer put in before the next crop is stored. The celery is immediately taken to the place where it is to be trimmed and washed. Most large growers have regular washing houses and racks or trays made of slats, on which the celery is placed after being trimmed. The water is then turned on by means of a hose, so handling being necessary except to turn the stalks over. If the celery is intended for a nearby market they are generally tied up in bundles holding either six or twelve stalks. These are then placed in crates in upright positions. If the celery is to be shipped in large quantities the celery is not often tied in bunches, but simply packed in an upright position in the crate.

Careful trimming, washing and packing are important. Often a fine quality of celery is ruined by careless handling, and too much stress cannot be laid upon these factors. The neatness and general appearance of the packages are often the means of a profitable sale. The growing of the crop is only half of the battle and to many truckers the easiest one. Poor product well packed and cleaned generally sells for more money than fine product poorly packed and dirty.

### A Great School.

St. Louis.—The demonstration school at the world's fair was a grand object lesson in modern methods of practical agricultural teaching. It brought together the best of the country, the best authorities in the country, professors and also plain farmers, in their respective specialties. With lantern slides, moving pictures and living and dead, they enforced their teaching through the eye as well as the ear.

Such people as Professors Holden, Hough and others, in respect to the Iowa, Illinois and Nebraska state experiment stations, and Mr. E. D. Funk, the great Illinois corn grower, conducted the departments of corn ideas with corn, corn products and charts.

Professor Mumford's demonstration from the buyer's point of view of the market classes of cattle, illustrated as it was with fifty head of cattle collected for this purpose by the Illinois experiment station, represented one of the most original and valuable features of the occasion.

In judging beef and dairy cattle and scoring sheep Messrs. Haecker and Burnett of Nebraska, Curtis of Iowa, Beach of Connecticut and Glover and Detrich of Illinois were among the authorities, and both cattle and sheep were handled in a most interesting manner. Grain and forage crops, with extensive exhibits, received attention from Saunders of the Dakotas, Ten Eyck of Kansas and Spillman and Suringie of Washington.

Moving pictures, so successfully used at this world's fair school, are likely to be a prominent feature hereafter in agricultural lectures.

### Renewed Usefulness.

The handles of garden and market baskets are broken, but the handles are not thus necessarily made useless. Save all the balls of worn-out tin and wooden parts and use them for handleless baskets in the manner shown in the cut. Two very stout screw eyes inserted in the rim of the basket hold the ball very neatly and securely, and the new handle really is often more convenient than the old—American Gardening.

**Agricultural Notes.**  
 At the New Hampshire station common cider, or windfall, apples, valued at 10 cents per bushel, were fed as part of the ration to pigs, but were not regarded as an economical feeding stuff.

An appeal to save the few quail and partridges that survived the hardships of last winter has been issued by the Massachusetts Game Protective association.

The Black Leghorn is a popular bird with those partial to this color. Its plumage is very handsome—a rich, glossy black with a red comb. The trolley is being found very convenient in Ohio for hauling farm produce to market, and it adds value to farms in other sections in the same way. As a Rural New Yorker correspondent writes, the new handle really is often more convenient than the old—American Gardening.

## PAROID READY ROOFING.

PAROID. The Roofing with NO TAR. Won't dry out. Won't grow brittle.

ANYONE can apply it. It's Nails and Cement in one of each roll.

REPRESENTS the results of 20 years of Experience and Experimenting.

ONLY requires painting every five years. Not when first laid.

IS Cheaper than Gavel, Slate or Shingles.

DEMAND FOR PAROID is world wide.

MADE IN 1, 2 AND 3 PLY Other Colors, Samples and Prices are yours if you will ask us.

L. C. WICK,  
 BUTLER, PA.

\$1.00 DELIVERED ANYWHERE in the United States.

Beautiful miniature, without "Chicken Clack." Unique hall ornament; excellent for carrying messages, etc. Every stock guaranteed. Perfect line keeper. Durable material for car parties; acceptable presents. Slowly the wheel turned, carrying us up the hill. The low price of Paroid ready roofing is the low price of Paroid ready roofing.

TRI-STATE TRADING CO.,  
 503 Keystone Bldg., Pittsburg, Pa.

## REMOVED.

We have removed our Marble and Granite shops from corner of Main and Clay streets to No. 309 N. Main street, (opposite W. D. Brandon's residence), and will be pleased to meet our customers with figures that are right on.

Monuments & Headstones of all kinds and are also prepared to give best figures on.

Iron Fence. Flower Vases etc., as we have secured the sole agency from the Stewart Iron Works of Cincinnati, Ohio, for this town and vicinity.
