SHADE GROWING.

Other Plants Under Tents. ers in producing a superior quality of whether a similar covering might not prove of value to other plants. Experiof vegetables and with strawberries made in 1903 at the Rhode Is-

The same kind of cloth was obtained as that used for the tobacco work, it ing a thin cotton fabric, similar to

ecloth. Three tents were erected One was placed over strawberries. This tent was covered on the top and on the south and west sides, leaving the north and east sides open, except for one breadth at the top. The cloth was put on this tent June 3, just as the berries were beginning to turn. The weather proved unfavorable for such a test, for a great deal of rainy and cloudy weather followed, causing a large amount of rot in all the strawberries. There was too little sunshine, even for those in the open field. Consequently the results were unfavorable rather than otherwise, so far as any were observed, but the effect was very slight at most. With hot, dry weather at picking time the tent might prove of value.

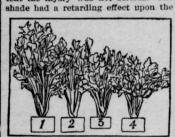

A tent open on all sides, having merely a top cover and a single breadth of cloth on the sides near the top, was used for cucumbers in comparison with similar plants in the open ground. Inside the tent twenty-two vines, in seven hills, survived the battle with the bugs and reached bearing size. Outside the tent twenty-nine plants, in seven hills, survived. Thirteen fruits, weighing altogether two pounds and one and onehalf ounces, were harvested on vines weighing nine pounds and two and three-eighths ounces, were harvested from the outside vines. The tent covring seemed to prove of no value in warding off beetles or mildew. In fact, the shaded plants seemed to be even more badly diseased than those in the open. It was felt that with cucumbers the tent must be left open to permit of the blossoms being pollinated by in-

In the experiment with lettuce, cel-ery and cauliflower, a long tent was , divided into two sections. The south section was entirely closed. The north section was left open on the north and east sides. As the season progressed it was observed that the celery under the tent appeared better than that outside. It was lighter in

color, more upright in growth, and the stalks were decidedly longer. When harvested in November the celery from the open tent averaged 25 per cent taller than that grown in the open ground, and that from the closed tent averaged 40 per cent taller. The celery from the closed tent was better in other ways. Not only were the stalks longer, but the color was better, being more nearly blanched, and there was less waste material in the shape of roots and leaves. Plants outside of the tents suffered much more from early rost than did those inside.

The flavor of the celery from the grown outside. In the matter of ten-derness very little difference was to be observed. The celery grown inside the closed tent seemed slightly more stringy than that grown outside. It is possible that the better flavor of that grown inside may have been due in art to its having been more complete-

tents appeared to be less marked. Those under the open tent were badly ured by worms. Under the closed ent the injury was not serious. The

CELERY FROM SHADING EXPERIMENT.

heading, those plants under the tents being later in maturing than the ones grown outside. Several of the outside plants were killed by the root maggot. The tent appeared to give a decided advantage to transplanted lettuce. The plants started off more promptly, and fewer had to be replaced. That in the closed tent appeared to do a trifle better than in the open. Aug. 20 lettuce inside the tent was apparently not heading as well as that outside, but the leaves appeared to be more tender and delicate. As far as full comparison of yields are available they show a much neavier yield from plants grown in the open ground.

GREAT FACTS FROM OHIO.

an Silage Be Made the Principa Element In the Dairy Cow Ration? By C. G. WILLIAMS. The prevailing high prices of grain feeds in the face of very moderate prices for dairy products have reduced the dairyman's profit to a point where it is a question with him whether he can make the cow pay for the large grain ration he has been accustomed to feed. If he can dispense with half the grain he has been feeding without materially reducing his production of milk or poorhouses, though there are many and butter fat his chances for profit

The object of an experiment at the Ohio agricultural station was to deternine whether silage might not be sub stituted for a considerable portion of the grain usually fed to dairy cows. Two rations were fed carrying practically the same amount of dry matter. In one ration over 50 per cent of this dry matter was derived from silage, and less than 18 per cent was derived from grain. In the other ration over 57 per cent of the dry matter was derived from grain, no silage being fed.

Ten cows, representing five different breeds, were fed these rations from two to four months, five cows taking the test the full four months.

The cows fed the silage ration pro duced 96.7 pounds of milk and 5.08 pounds of butter fat per hundred

pounds of dry matter. The cows fed the grain ration produced 81.3 pounds of milk and 3.9 pounds of butter fat per hundred

ounds of dry matter.

The cost of feed per hundred pounds of milk was \$0.687 with the silage ration and \$1.055 with the grain ration. The cost of feed per pound of butter fat was 13.1 cents with the silage ration and 22.1 cents with the grain ration. But Oi didn't know ye tion and 22.1 cents with the grain ration.

month (over cost of feed) was \$5.864 with the silage ration and \$2.465 with

the grain ration.

Comparing the average daily product of each cow for the entire test with her average dayly product for the month previous to the change in ration (or the irst month of their test in the case of two cows), the cows fed the silage ra tion shrank 2.84 per cent in milk and gained 1.89 per cent in butter fat production. The cows fed the grain ra-14.18 in butter fat production. Upon the conclusion of the experi-ment each lot of cows was found to

fed cows an average of forty-seven pounds per head, the grain fed cows an average of fifty-seven pounds per head. The facts herein reported seem to justify the conclusion that silage can pe made to take the place of a considerable portion of the grain ration. It is believed that by growing more of the feeds rich in protein-clover, alfalfa, soy beans, cowpeas, field peas, vetches -and ensiloing them or feeding them as hay it will be possible to further reluce the amount of grain fed.

MOISTURE IN THE SOIL.

An important question with farmers how to prevent losses of moisture from the soil by evaporation. These losses are often greater than most of us real ize. It is stated by Professor Jeffery of the Michigan State college that losses by evaporation where the soil is well supplied with moisture may amount to an inch of water in four days. Otherfacts and ideas from the same author

ity are as follows: It is generally be lieved that the more frequent the cultivations the greater the saving of mois ture. Generally speaking, this is true so far as has been studied for clays, loams and possibly sandy soil. It is not true for all soils. Soils rich in organic matter, such as the muck soils, profit by single cultivation, but so far as they have been studied frequent cultivations do not promote the further saving of In practice it is found that, with cul

tivated crops on the soils indicated, fre quent cultivations with cultivator, har row or weeder not over two inches deep prove most satisfactory.

It is found, too, that those who are

most persistent in frequent shallow cultivating find it a profitable practice The harrowing of grain crops is con ing a good deal into favor. Going over the winter wheat field one or more times in spring with a spike tooth har row is found to give good results Some farmers in the west practice has high as to be apparently considerably

oroken down by the harrow bars.

The Dry Earth Mulch. A layer of dry soil is much more effective in preventing moisture evapora tion than a layer of like depth of moist soil, and so it is sought by many in practice to develop by frequent cultiva-"blanket." using the harrow, weede and later the many toothed cultivator.

Using the Roller on Grain. The use of the roller upon a field of grain after the grain is well up gives excellent results in cases where the surface is lumpy and dry. The reason lies largely in the fact that in crushing the lumps a dry earth mulch is devel oped to lessen the evaporation, while the packing of the soil may have the effect of improving capillarity below.

ports that cucumbers, watermelons and muskmelons grown under shade were not a success. The vines grew well but the fruits were small. In the case of cucumbers a few reached small closed tent was much superior to that outside. That from the open tent seemed to differ but little from that

Boys are frequently lost in the woods, and it is a singular fact that birds are sometimes lost in the air. This might With cauliflower the influence of the the average man is a superficial ob

server of little things.

In the far north, and particularly along the ocean coasts, birds are fre quently storm driven and lose their bearings, so that many of them are lost at sea. They keep floating in the air, gimlessly striving to live until exhaustion compels them to drop into the an gry waves, which engulf them. There is a well authenticated case or

record of an ocean liner bringing into New York on a winter's day a large white owl which had dropped to one of the forward spars in an exhausted condition more than 800 miles off the coast of Newfoundland. It was near-ly dead from cold and hunger and alnost too weak to eat anything. It had become much emaciated and tremile in its distress when it tried to swal low the first morsel of meat which was placed within its beak. The captain and sailors were all interested in it, and under their nourishing care it slowly recovered and became entirely

ingly remained with the ship after It was evidently a land bird which had been blown off from the coast of Newfoundland by strong west winds, had become lost, merely drifted belast intelligent effort to reach the ship

fore the gales, kept out of the water almost starved to death and made its lapse.
Old sailors narrate many other in-

stances of finding birds that have been lost in the air.—St. Louis Republic.

With all our high wages and boasted civilization the fact remains that you will see more wretchedly poor in any of our great cities in a day than you will see in Japan in a lifetime. In other words, you will see no destitu tion in Japan. Though some are very poor, yet all seem to be well fed, clothed and housed and are invariably cheerful and, what is more surprising, invariably clean. There are no paupers in Japan and therefore no workhouse hospitals where the sick are healed gratuitously. Practically every one can earn a living. Would that we could say

Dust and Consumption. Dusty work seems to be responsible for consumption to a marked degree. In 2,161 cases of consumption treated at the sixty institutions of the Ger-man empire 1,095 patients had been employed in a dusty environment. The kind of dust was not stated in 431 cases: in 182 cases it was metal dust in 129, stone, coal or glass dust; in 113, wood dust; in 111, wool dust, and in 126, various other kinds of dust.

"Ain't got no use for it!" snapped the

busy merchant.
"Oh, yes, you have! Look at the title, "The Art of Conversation and Correct Speech." - Philadelphia Ledger,

\$500 REWARD

WHO CANNOT BE CURED. WHO CANNOT BE CURED.

Backed up by over a third of a century of remarkable and uniform cures, a record such as no other remedy for the diseases and weaknesses peculiar to women ever attained, the proprietors of Dr. Pierce's Favorite Prescription now feel fully warranted in offering to pay \$500 in legal money of the United States, for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb which they cannot cure. All they ask is a fair and reasonable trial of their means of cure.

The Vice-President Independent Order of Good Templars.

An experience which many women have was have gained in live weight-the silage

An experience which many women have was related by Miss Agnes Stebbings, of 231 East 30th Street, New York City, as follows: "I had very poor health for a year until life locked dark and dreary to me. Had head-aches, backache, also pain, my sleep was broken and fitful. I longed for health. Tried several medicines but none were of any lasting benefit until I took Doctor Pierce's Favorite Prescription. I soon realized that I had found the right remedy. It helped nature to throw off the poisons that saturated the system, removed all pains and strengthened the digestive organs, and brought the roses of health back to my cheeks. This medicine if taken occasionally keeps the system in perfect condition, helping it to throw off the disease and consequences of exposure to dampatess. I am pleased to give it my endorsement."

"Favorite Prescription" makes weak

"Favorite Prescription" makes weak women strong, sick women well. Accept no substitute for the medicine which works wonders for weak women. Dr. Pierce's Common Sense Medical Adviser is sent free on receipt of 21 one-cent stamps for the paper-covered book, or 31 stamps for the cloth-bound. Address Dr. R. V. Pierce Buffelo, N.
