larger than they usually are, and their qualities much improved, simply by sup-porting the fruit in the following mannor:-As soon as it is fully developed, it should not be allowed to hang its weight upon its stalk, as the increasing weight strains the stalk, and in that way, lessons the quantity of nutritious fluid flowing to the fruit. This may be obviated, in some cases, by laying the pear, apple, o what ever it may be, upon a branch, and fixing it with a piece of matting, io pra-vent its being moved by the wind ; or by putting it into a small net made for the purpose, at the same time, keeping the stalk in a horizontal position, when it can be done without twisting or ben ring itas the bending, either accidentally or by the weight of the fruit, is, in my opinion most, injurious; to us growth ; for the pures of the woody stalk are strained on one side of the bend and compressed on the other; hence the vessels through which the requisite nourishment flows be ing thus partially shut up, the growth of the fruit is retarded in proportion to the straining of the stalk. The fixing of the fruit also prevents the risk of its falling off and getting damaged before it reach-es maturity. I have grown dahlias upon the same principle, and with similar success, and I have no doubt that the most of flower blooms, especially those

which are weighty and inclining, can be grown much larger by the system refer red to, and in short, all sorts of vegeta bles, trees, etc."

CULTIVATION OF POTATOES.

The old practice of hilling up corn and potatoes, is discarded by the best cultivators. Still there are some who yet cling to the old waysthat might be of benefit in a wet and hurmid climate where a necessity exists for the plants up out of a superabundant moisture. But in a climate like ours, where long continued droughts parch up the earth as "they frequently do in many sections, the flat culture, with planting on or below the surface, is the better plan. Where the soil is well underdrained and subsoiled, potatoes planted below the surface. Without any hilling, succeeds the best. In such situations the superabundance of rain passes down through the earth leaving its ammonia and other fertilizing principles for the benefit of the growing plants, while in the dryest weather the roots of the plants 'search ' their food so deeply in the generous soil that they keep in a vigorous condition.
