Agricultural.

TO CHOOSE A-GOOD MILK, COW

Select from a good breed. We prefer the Devons-bright bay red. The Durhams are red, roan, white, and mixtures of these colors. Ayrshire cows are generally red and white spotted. Herefords red or darker colored, with white faces. Alderneys pale red and mixed with white. These are the principal colors of the several breeds, of which the Durhams are the largest and Alderneys the smallest. Different individuals will contend for each breed being the best and only one that should be selected for their milking qualities. But animals of each breed and of crosses of them, often prove remarkable milkers, and so do some of the native stock of the country. Two famiies of cows, one-owned by Col. Jaques of Ten Hills Farm, near Charleston, Mass., and one owned by Major John Jones of Wheatland Farm, near Middletown, Delaware, were called native breed.

If we were about selecting a milk cow, we would endeavor to get one out of such a herd of good milkers; one with a soft, velvety-feeling skin, slim neck, fine legs, broad stern, with what is called a large escutcheon, that is, the hair of the stern pointing inward; a large udder, slim teats and large veins, commonly called milk veins, on the belly. Above all, se-Tect your cow of a gentle, pleasant. countenance, because a first-rate milker may be so vicious as to be worthless. Do not look for flesh, as the best cows are seldom Tat; their hip bones are often very promfnent, and they have the appearance of being low in flesh. A beefy cow is seldom a good milker.

The next thing is, what is a good milker? That is, how much milk must she yield per day? A cow that will average five quarts of milk a day through the year, making 1,825 quarts, is an extraordinary good cow. One that will yield five quarts a day for ten months is a good cow, and one that will average four quarts during that time is more than an average quality. That would make 1,200 quarts a year, which, at three cents a quart is, \$36.— We believe the Orange County milk daries average about \$40 per cow, and the quality of the cows is considerably above

the average of the country. It is as important to keep a cow good as it is to get her good. This can never be done by a careless, lazy milker. Always milk your cow quick and perfectly clean, and never try to counteract nature by taking away her calf. Let it suck, and don't be afraid "it will but her to death." It will distend the udder and make room for the secretion of milk. Be gentle with your cow and you will have a gentle cow. "Select well, feed well, house well, milk well, and your cow will yield well.—New York Tribune.

FALL PLOUGHING.

·While perusing the columns of the "Newspaper," I have looked a long time to see brought before the public, the recommendation of fall ploughing for the spring grains; and being much interested in the farmer's department of the "Newspaper," I take the responsibility to introduce a few remarks into its columns.—For several years I have noticed the fact that the different kinds of grain produced better, and that spring wheat not so liable to be affected with rust, if sown on land ploughed in the fall. Farmers who have fall and spring ploughing in the same field side by side, and putting the same kind of grain in both parts, will notice the fact very clearly. I remember noticing last summer, about the middle of June, a field of wheat, a part of which was at least one fifth larger than the rest, and healthy, fresh, and green; while, on the other hand, the rest appeared dried up, small and withered. On asking the tiller of the farm the reason of the difference, he replied that it was all the same kind of grain, and all sown the same day; but the wheat that looked the best was on fall and the other on spring ploughing. -And let me remark that the harvest showed the difference that was apparent in the

month of June. The reasons assigned for this difference are: first, that the stubble and weeds, if it be stubble ground, serves as a manure, and by being turned under in the fall, their fertilizing powers are all applied directly to the soil, while otherwise if the natural refuse matter was left on the surface during the winter, its best qualities pass away and are partially lost in the form of gas. My second reason is that the frost during winter has more surface to act upon, by having the ground thrown up light in the fall.

> From the Germantown Telegraph. WHEAT.

MR. Epiron:—The other evening, while

looking over the Report of the Commissioner John C. McAllister, Dauphin, of Patents-No. 11, on Agriculture, I was struck with the following remarks on wheat,

which I extract from page 207:
"There is no crop, the skilful and successful cultivation of which on the same soil, requires more art than is demanded to produce good wheat. To grow this grain on fresh land, adapted to the peculiar habits and wants of the plants, is an easy task. But such fields, except in rare instances, fail, scioner or later, to produce sound and healthy plants, which are little liable to attacks from rust, or which give lengthened cars or "heads," well filled with plump seeds."

In relation to unfertile lands, the writer

*Soils are defective in the following par iculars: 1. They lack soluble silien, or flint n an available form, with which to produce hard, glassy stem, which will be little sub-ect to "rust." Soluble flint is never very abundant in cultivated 'soils; and after they have been tilled some years, this supply is deficient in quantity. It is not very difficult to learn with sconsiderable accuracy the amount of silica which rain water oas it falls on the earth, will dissolve out of one thousand grains of soil in the course of eight or ten days. Hot water will dissolve more than cold: and water charged with carbonic avid, more than pure water which has been boiled. * * 'Earth taken from an old and badly xhausted field in Georgia, gave the writer uly one part of soluble flint in 100,000.

Now, if a certain quantity of soluble flint is indispensably necessary to the perfection of wheat, and that it is there can be no question in any reasonable and candid mind, it s by no means surprising that soils in which it does not exist, do not, and cannot produce good wheat. This subject is one of immense practical importance to the farmer, and should I have time, I may hereafter allude to it again, and in a manner somewhat more methodical and direct.

LIST OF COMMITTEES Of the Penn'a. State Agricultural Society...-September, 1854.
