Agrienttural.

Keeping Winter Apples.

A great many persons lose their winter apples, not because they will not keep, but because they do not know how to keep them. We commend the following to the attention of all. Recollect that too much importance cannot be attached to kéeping apples in a cool place, but where they will not freeze.

The keeping of apples and other fruits depends very much upon the care with which they are gathered, and the place in which they are deposited; hence a few hints on the subject will not be valueless to the orchardist and gardener.

Late autumn and winter apples belong to that class of fruits which are gathered before maturity, and ripened in the fruit room or cellar; and they should be picked when they have received from the tree all the valuable elements the season will allow it to give them. English gardeners have a rule that no fruit should be suffered to remain on the trees after they cease to vegetate, and this is in general a good one. The apples above spoken of, as well as pears of the same class, may remain ungathered until there is danger of injury from frost, as the sun and air, and the still remaining vigor of the tree seems necessary to their perfection and maturity.

Apples designed for long preservation should as far as practicable be picked by hand, carefully and separated, and when they are not wet by dew or rain. They should be handled so as not to bruise them in the least, as carefully almost as eggs or glass ware. Lay them gently upon the floor of a cool dry room, a foot deep, to sweat and season for two or three weeks; and then, on a clear dry day, sort and pack the apples in clean dry barrels, filling them so full that the apples cannot move after being headed in. The very best, which will keep longest, may be wrapped up separately in soft paper before packing, or they may be placed in layers with dry chaff around and between

Most cellars and ground floors are too damp for the perfect keeping of apples through the winter and spring, and also of too variable a temperature—the latter should not vary much from forty degrees. If an upper room can be so prepared as to retain about the same degree of heat, dryness, and darkness, it is a very desirable locality for the preservation of fruit, not only apples, but pears, grapes, &c .-To the preservation of the two last named, considerable attention has recently been paid.—New Yorker.

Bearing years of Fruit Trees.

We have ever been strongly inclined to the belief that if fruit trees are properly managed, they bear fruit every year. It is strange that it should be otherwise, and numerous facts distinctly point to the difficulty in the way of securing this re-We accidentally came across a statament of the Hon. J. W. Proctor, of Danverse, Mass., on this subject, which we here transcribe. Mr. P. says: "I will state certain facts, that have come within my own observation.-I know a Baldwin apple tree, that has been in bearing condition about thirty years, which uniformly bears from five to ten barrels each year. It stands about one hundred feet westerly of a large barn, and about thirty feet from the road. Directly opposite the tree, is a gutter, that takes the wash of the road. The proximity of the barn-yard and the highway, affords all the nutriment to the tree that can be desired. Whether these are the causes of its constant-productiveness, I will not say, but presume they are. If they are, the fact has a tendency to show, that in good positions, with good culture, trees may be made to be constant bearers; and that their intermission in bearing is to be attributed to the exhaustion of their qualities and not to any general law that forbids their bearing every year. I know another tree that bears a superior fall Harvey, that has borne constantly, for more than twenty years. * * * If by culture and attention trees can be made to produce every other year, it is a fact important to be established."

From published accounts of Mr. R. L. Pell's orchard management, (and he is the owner of the largest and most productive apple orchard in the country,) he has established the fact, that apple trees can be made to bear every year, by supplying the necessary food for the trees

and fruit. The compost he manures his orchard lands with, is not made by guess, but is compounded with reference to the kinds and quantities of elementary substances composing the wood, bark, leaf and fruit of the trees, as deduced from analysis. A plant can be fed with its appropriate food, as well as an animal.

Use of Lime.

Quick linge should never be used in combination with animal manure. When in contact with them, it sets the ammonia free, and impairs, nay, destroys the effi-cacy of such manure. Mild lime, or lime that has re-absorbed the carbonic acid, which has been driven off in the process burning—marls, shells, marl and shellsand, being carbonates, do not exert the baneful influence of quick lime, and therefore may, very advantageously be used in connection with organic manures. Marls, in every form, may also be used with barn yard and stable manures, or any other kind containing ammoniacal compounds, as the lime in them, being carbonate, cannot exert any injurious influence upon them.—
Marl might even be used with guano, the most concentrated of all animal manures, and no ill effects would flow from its application, whereas, if fresh lime were used all the nitrogenous parts of the guano would be driven off and left to the grano of the guano of would be driven off and lost to vegetation, while nothing would be left but the mineral portions.

Persons having marl deposits could not make a more profitable disposition of their marl than by covering their barn-yards and stable floors with it, to act as an absorbent, and retainer of the liquid manures of their stock.

Preserving Butter.

The farmers of Aberdeen, Scotland re said to practice the following method of curing their butter, which gives it a creat superiority over that of their neighbors: Take two quarts of the best common salt, one ounce of sugar, and one ounce of common saltpeter: take one ounce of this composition for one pound of butter, work it well into the mass, and close it up for use. The butter cured with this mixture appears of a rich marrowy consistency and fine color, and never acquires a brittle hardness or tastes salty. Dr. Anderson says: I have eaten butter cured with the above composition that has been kept for three years, and it was as sweet as at first. It must be noted, however, that butter thus cured requires to stand three weeks or a month before it is used. If it is sooner opened, the salts are not sufficiently blended with it, and sometimes the coolness of the nitre will be perceived, which totally disappears afterwards."

Profits of Shade Trees.

Let a farmer plant out by the road side 100 trees, at a cost of \$50, (and this is a liberal estimate,) in ten years' time that farm will sell for \$500 more than it would without them; and I venture the assertion, the owner would not have them removed for that sum. Whatever adds to he value of real estate, and has an increasing value, must be profitable. It cannot be otherwise. Now, if shade trees do this, the question is settled. Will any sane man contend that the shade trees in Cleveland, Rochester and New Haven, or any other city where numerously planted, have not done much to add to the value of real estate in those places? What is true of the city would be equally true of the country.

Management of Manure Heaps.

One of our foreign exchanges, has a communication from Mr. Robert Austin, Manchester, who says that upwards of a ton of horse dung is made in his stable daily, and the usual offensive odor and evaporation from it entirely prevented by sprinkling over the dung heap by means of an ordinary water can, a solution of a pound of coppers in a gallon of water.

"The value of this chemical agent in fixing ammoni, and strengthening manure has long been known, but Mr. Austin's communication from Mr. Robert Austin,

has long been known, but Mr. Austin's practical application may be considered simple, effective and easily adopted in tur similar cases.''

Black Knot on Plum Trees.

A writer in the Cultivator says that Mr. Wm. Smith, of Ballston Centre, this season "removed all the diseased branches from his trees, and around a portion of them set out the tomato plant, leaving a part uncared for. Those with tomatoes at the roots have no knot whatever, while those not treated in this way, were full of black bunches the same as last year."

MAP OF CUMBERLAND COUN TY.—From entirely original Surveys, by actual rement throughout the whole county, by H. F

BRIDGENS.

The subscriber is now engaged in making Surveys preparatory to publishing a new and complete Map of Cumberland County, upon a large scale. Every Public Road and Stream, with the locations of all Mills: Stores, Dwellings, and Public Buildings, will be necurrately laid down. All the Public Buildings in the County will be distinctly indicated, and the names of owners of property generally, will be inserted in their proper positions on the Map.

A Table of distances, Statistics of the County, enlarged plans of the principal Villages, and a few of the

A Table of distances, Statistics of the County, enlarged plans of the principal Villages, and a few of the most attractive views in the County, will be inserted in the margin; thus giving every satisfaction, and rendering the Map most valuable to the Owners of Property, Morebants, Travelers, Conveyancers, and the inhabitants generally, of the region delineated.

In as much as this work is to be made up of actual surveys made upon the ground, it will require time to accomplish it; it is not expected, therefore, that it will be ready for publication much under the period of Two Years. The size of the Map will be about five feet by four, and will cost five dellars.
