

Fall Planting of Trees.

"Do you approve of fall planting?" is a question asked us every day. Our answer is, yes, under these circumstances:

1. When the ground is of such a nature and in such condition that water will not lodge around the roots of the trees during winter. To plant trees in holes sunk in stiff, tenacious soils, is a certain method of killing them.

2. The trees should be perfectly hardy. All delicate or half-hardy trees should invariably be planted in the spring. If it be necessary to take them up in the fall, they had better laid in by the roots in a dry soil, sheltered from the cold, cutting winds, and, if necessary, protected with boughs of evergreens or something of that

nature. 3d. We do not approve of planting evergreen trees in the fall, unless the very hardiest-sorts, and that quite early, say in September or first of October, in time for the trees to re-root, partially before hard frosts; and they should be sheltered from the sun and wind by a thick screen of evergreen boughs well secured around

4th. Plant all trees early—as soon as circumstances will permit after the wood is ripe. Don't wait till the leaves fall, but cut them off, being careful not to injure the buds. Late planting however, if well done, may be equally successful. We transplant any time most convenient, between the first of October and first of May. Last winter, in December, we planted several hundred of specimen trees, from one to six years old, and lost not over two or three in the whole. Many of the bearing trees, notwithstanding the drouth, have borne and ripened fine specimens of fruit.

5th? Secure all trees from being blown about by the winds, and mulch with halfrotten manure or leaves three or four inches deep.—Horticulturist.

Application of Manure.

· A judicious and well-timed application of manure is a subject of good importance to the farmer. If he had a complete knowledge of the deficiency of the soil, and of the organised constituents of his manure, an economical application might be made with comparative ease. But it is not so, and he is compelled to study and experiment, until he becomes practically familiar with this part of his business, and better able to judge what quality is lacking, and what he has in store as a necessary supply.

necessary to render a tenacious soil productive; one that shall drive the particles asunder, and "warm up the soil," as the saying is. The atmosphere plays a lively part in the production of all vegetables as well as animals. Hence the importance of cultivating the soil by plowing, hoeing, &c. Nitrogen in the form of ammonia or some other compound, escapes from fermenting substances. If the process is going on therefore, in the soil, the nitrogen will unite or combine with some ather substance supposed to be present, ond thus form a nutriment for the plant. The escaping and expanding gases have much to do in such a case. They disintegrate the hard and adhesive lumps, and render them so porous, that the air has very free access.

Le Now if this manure had been applied to the surface, we can readily see that most of its power would have been lost, and its virtue too. So, also, if fermented manure had been placed in such a soil, its effects would have been much less than the unfermented, because the former is composed mostly of the ashes ofplants and mineral substances, of which the soil may have already a competent supply, and no new power be given by the addition of these comparatively inactive elements.

A different compost is necessary when the seed and not the stalk, is the object of cultivation. The phosphates or phosphoric acid must be present for the formation and perfection of seeds, such as wheat, corn, &c., while for grass designed to be cut for hay, it may not be essential.

In the vegetable world, "like produces like," and the decay of plants produces food for the reproduction of the same plants, and if they decay upon the soil without loss, the present crop will furnish materials for a larger subsequent crop. where the grape is cultivated in many places, the only manure used, year after ceived and for sale cheap at H. SAXTONS.

year, is leaves and trimmings of the vines carefully placed around the roots, and slightly covered to promote their de-

If we place our corn cobs in a proper state of decay, upon our corn ground, we may perhaps, gain more in the end, than we should to have them ground into meal -or certainly than we should to throw them at random into the compost heap, to be applied without a future crop.—American News.

Heading Cabbages in Winter.

The following plan to accomplish this desirable end, is that which, we are informed, is adopted in the New England States, by the best farmers and gardeners We invite to it attention in this region, as we not unfrequently see much cabbage, which failed to head in the fall from various causes, either pulled up and fed to stock or left a prey to the frost.

Select a suitable spot in a garden or field, six feet in width, of any devised length, free from standing water; run a furrow the proposed length of your bed, and throw a back furrow upon it. This double furrow will form a side wall of your cabbage house. In the trench stand your cabbage on the roots, leaning towards the furrow at an angle of 40 to 45 degrees. Let the next furrow be thrown apon the roots and stalks of cabbages, and another row be placed in the trench made by the second furrow; thus proceed until your six feet of width is planted, then let the last furrow be a double one making the other side wall about the height of a cabbage head. Through the whole length of the middle of the patch lay rails lengthwise, supported by crutches, at a height of about two feet from the cabbages; this will form the ridge of the enablages; this will form the ridge of the cabbages. Lay light brush wood sabbage-house. Lay light brush wood from the side-walls to the ridge pole; then throw on salt hay, or bog hay, or straw, two inches in depth. As the cold weather advances throw on dirt until you have a depth of say six or eight inchesor even more, when the winters are severe, and finally spank the dirt roof with the flat of a spade, until it will shed the rain. Fill up the two ends of your house in the same manner, leaving only small air-holes of a foot or two diameter, which may be closed with hay, and opened occasionally on a fair day. The length of the house should be on a north and south

In the early spring you will find your most unpromising plants have heads of their own; and all be thriving and fresh. Try it once, and you'll try it ever after-

Stores and Shops.

THINA, GLASS AND QUEENS-WARE—Old honsekeepers and young, with those also who are expecting to become housekeepers are invited to call at HALBERT'S FAMILY GROCERY and exand is call at HALBERT'S FAMILY GROCERY and examine his elegant assortment of China, Glassand Queensware and other articles in the housekeeping line, such as French and English tea sets, heavy banded and plain, White Granite, gilded and blue plain, Dinner sets of overy variety and price, bowls, and pitchers, turcens, dishes, &c.
