

Mr．Editor：－As a general rule， a not in favor of＂mixed husbandry， whin do not almit of exceptions．I ha：long been an undecided question， －an actual injury to the crop．I have a e：an actual injuyy to the crop．I have ．o pist scason，had taken no pains to
a certain by experiment．fast year I hill a piece of enrn on the South side o hilh or rather gentle déscent，and as it truented a favorable opportunity， 1 de
turnined to make the trial．There were lifty rows of thirty－six hills each，in the p ce．Commencing on one side，I coun－
$\mathrm{t} \mid$ uff eight rows，and planted the ninth， nth，cleventh and twelfth to corn and b ms－Iropping the beans nut with the ＂n，hut abuat wis inches on one side． ad the next fuir platited in the same way：the remander of the entire piece It harvest the first rows having the bems in them，were cut and weighel， ad then the finer rows immediately con it The satme cousse was pursued in fofence to the other rows，and the row hearest them on either hand，and the re salt was that no perceptible difference by the rows havingt of corn produced and that of tha means in the hills， soil throurhont the piece was as wearly the same yuality as it well could be，and the management of the entire piece was
in every respect the same．The bean made a very good crop，were all fille Flump and fair，and the corn was also nod．The manure used，was short muck wae shovel full to the hill．The crop er applied to the hill at second hoeing． It is probable that as different veget bles reguire a different specific aliment the bean finds enough of its appropriat food in the boil without at all infringing upon that which is required for the sup ard flourish on the same soil without in erfering with each others right．．－－
There may be other and more phulosophi cal explanations，but this satisfies me．

## Lime on Fruit Trees．

＇A Farmer，＇，in the $G$ rmentown Te praph thinks that lime，applied by itself rath，such as is frequently put on youns rechards indiscrestly，although serving to the the insects with which it comes into is poteucy generilly injurest he trees by nend，after bot I unhesitatingly reco oraped off，to whitewash bark has been imbs within－reach，with a mixture of lime，fresh cow manure，flour of sulpher the soot carefully saved from stove－pipes， one refuse salt，and a portion of spent ashes；a small quantity of saltpeter is al－ misture is an admirable wash to to with a mon whitewh brush and all who used it will be well rewarded and I think lime is an important ingre dient that should not be ouitted．Here he time that those who can afford ad labor heir trees，atter being seraped having h：m of all rough bark，washed with di uted soft soap；and，when dry then ap lyo above mixture．It is usually prepared by having old tar barrels or whitewash filled with common lime eral above named ich you put the sev and adnixiug them gradually by tho use a strong stick or paddle．

## Plaster Paris．

The Editor of the American Agricul a Mr．Chandler，he had learned with he could use green or unferinented ma－ ing thrifty，as is the case when well rot ted manure is used in this way，would be come yellow in color，and seemed to bo
injured rather－than inproved by it． Having read that Plaster of Paris would nia，he tried it in this．）After of ammo－ hovel full of green manure in the
