

The above are sample specimens of Peaches which were grown in a season of extreme

 Worthless and imperfect grown fruit, when not properly treated, and not true remedies are complied withr Bu
with treatments farorable for their inrigoration and the duration of peach trecs, and for rendering them capabl
of producing their fruits into full perfccion The trees can be restored healthy and vigorous fur scores of years, through favorable treatment.

But the true remedies which only can guarantce certain success in the cultivation of the above luscious fruit, are really not known and made use of or practised by tho hundreds or thousands who aro
 very, easy to comply with, which will accomplish, and to prove very certain in effecting very good and lastiug
results, inasmuch so as to have proven to restore trees with rank foliate. which had already been affected with tho yellows, to health, and to prodace fruits which were grown in full perfection
But in order that the whole points and mysteries can become presented in such a manner as to have full explanations to the whole and all the points, an Hllustrated Map is introduced and offered for
sale at a very reanonalle figure. And sianle peach trecs will, when uuder favorable treatuent, produce fruit per sale at a very reasonal,
Single Peach trees, when under improved and favorable treatment, at a proper age, will produce fruit to the value of from $\$ t$ to $\$ 6$ and $\$ 8$ per treo per annum; and an acre of such trees will bring in There is scarcely one case of an orchardist out of hurdreds of thousands who has ever reailized the real ralue of an orchard fre or ter acres in e extent, , of ecause they have never given their orchard a g god
chance or a foll trial. But there are numbers of orchards that wo have an account of, which are under favorable treatinent, of from five to ten acres in extent, which have yielded as much and really more clear profit per annum But, then again there are hundreds of thousands of orchards which
But, then again, there are hundreds of thousands of orchards which scarcely prove to produce sufficilat in value th justy the owners for sparing the grounds which they occupy. And why is this so
This is eutirely owing to the fuct, that such orchards hare not the treatinent rendered which they require for pro-
 which is needed to enable their orchards to prodnce heavy incomes? This is owing to the fact. That crehardists
have not the required information and instructions on those important points, and have nerer tried any experiments in order to make improvements, and thus have not, as yet, met with any great results and success to encourage them for giving their orchards a fair trial and chance.
What man is there who would not be encouraged if he could gain a profit of $\$ 300$ or
$\$ 400$ per annum from an acre of land? Surely, nll would be much encouraced if $\$ 400$ per annum from an acre of land? Surely, all would be much encouraged if they conld do so. That can, in a reanonable manner be done, with much convenience, if the proper means are made use of, and if a.fair trial is
given. The alove aniount can be made from one acre of land, in an orchard wilh good and improved treatment, and with a real good chance, and we can give good reason why.
Single apple trees, under good and favorable treatment, have proven to produce from Wenty-five to forty bushels of apples, which have heen sold at from 75 cents to $\$ 1.25$ per bushel, which woold rate the amuont of income per tree at aloout $\$ 25$ per acre. Then just thirty trees per pere would insure an income of a
fancy sum of $\$ 750$. But with uufarorable treatinent, such results cannot become produced, neither such heary incomes be expected
But a Mar is now introduced in which information can be obtained to rear up trees, , And will, in due time, produce much greater incomes than the above alluded to. And if modes, which are

```
pointed out in the map are closely complied with, will add
which can becone rendered to orchards in all time to come.
```

Then it can with full assuranco be guaranteed that single apple trees can become formed in due season, which will produce from forty to sixty and seventy-five bushels of apples in a season. And should any one doubt this, then they need only spare $n$ few dollars to procurce a masa, and you will only need to try
the improved treatment closely as directed, to the use of one tree, aud in a few years you will realize the differenco the improved treatment closely as directed, to the use of one tree, and in a fer years you will realize the differenco
between making an improviement or none. In a map it will become ascertained that there is a very beneficial improvement pointed out for preparing the soil with much conveuience before planting trees in, which will insure a certain guarantee to
render fruit trees very productive in low, wet aud unfavorablo soils, aud in uufavorable seasons, and it will be found that the mode for preparing is done with much care and convenieuce
In the last place, the map contains the most improved information on the keeping and preserving of all kinds of fruits, that can be introduced, to guaranteo cortain success, and especially for keeping
apples. It points out how to put them away to insure them to keep with much success tho whole year round, and appes.
especially such as Rambo and other early winter apples ; it insures their succossful kecping. until next harvest, or until there are apples again: The information or instruction which is contained in a map, for keoping apples with
success, will be worth from five to ten and twenty times as much per annum as a map will cost to hundreds and thousands, in proportion to extent of orthards or fruit growing. Price per single cony only $\$ 2$, or ten copies to one address will be furnished for
advance, They will be forwarded by express to nny parts ordered, on receipt of the required amount.
We require and desire the names of all such, and their residences, who may at any time be found out to copy, or steal information from maps of other purchasers; or, in other words, stich who refuse purchased by others, such nro to become reported to hoad tuarters, and expect our acouts and postmasters to sea to the bame, as-such copying and acts on the part of any, would be cousiderod as swindling that sum out of us. As we have put the price of the map at such a very low figure, in order that it will prove in the reach of every family tis procure acopp. The pice of the map ought to bo about ten dollars, and then the purchaser could yet doubla honest-thinking. man will procure a a copy for himself, and of course do not think of copying from those which crs have purchased and prid for,
All postmasters are appointed agents to receive subscriptions and money for the same, Address,
