THE RIVAL OF NIAGARA.

THE GREAT CATARACTS SOUTH AMERICA—NEARLY EIGHT HUNDRED FEET FALL—A COLUMN OF SNOW WHITE FOAM.

MR. RICHARD BROWN writes to the LONDON TIMES, on the 24th ult. In the month of April, a waterfall of most unusual height, was discovered on the Potaro, a tributary of the Essequibo River, by Mr. R. Brown, a Geologist and a member of the Geological Survey of British Guiana. Being short of provisions, and at a great distance from the place where he was to be met, he was obliged to descend the river at the rate of 100 feet to his depth, 150 feet. On his return to Georgetown, he was accompanied by a careful surveyor, and on the 10th inst. he was met by Mr. Brown, who was accompanied by Mr. King. The result of their joint observations is contained in an article published in the Standard paper of 3d inst., which, perhaps, you will deem sufficient in detail to satisfy your curiosity. It is a very interesting and well-written paper, and contains a full and accurate description of the waterfall, and of the surrounding country. It is a very rare opportunity to see such a magnificent waterfall, and it is a pity that the public should not have more knowledge of it. The waterfall is situated in a very remote part of the continent, and it is not possible to visit it without a long and arduous journey. It is a very beautiful sight, and it is a pity that it should be so little known. It is a very rare opportunity to see such a magnificent waterfall, and it is a pity that the public should not have more knowledge of it.
