## HOW TO SET A BEAR TRAP

It is not so complicated a task, to set a bear trap successfully. The guides of New Brunswick may tell you it is, or their brothers of the Rockies may object to carrying a heavy trap into a country where they know a good rifle will be pretty sure to get your bear for you. But if you still insist on assuming the role of the trapper, if only to test your woodcraft, then the first thing to do in to get a good trap. You will want a No. 6 for grizzlies; a No. 5 will do for black bears. For the West your trap should weigh not less than twenty pounds, but for the bears down East twelve or fifteen-pound trap will do if it has good springs.

It is the usual thing to build a rough V-shaped pen in a windfall, located, of course, where bears are using, and place the bait in the small end of the V. This pen should be constructed of heavy logs and brush picked up without any ax work, and should preferably be in a depression of the ground with a fairly open trail leading into it. It is a good plan to use a standing tree a foot in diameter for the back or inside end of the pen, and the walls should be jammed tight against this tree and be belthigh at the tree.

Across the entrance of the pen. after the balt is in position, place an old dead branch of a tree, one that is comparatively straight and strong and not more than two inches in diameter. Wedge it in firmly between the logs of the walls. This is for the bear to step over, and it should be eight or ten inches above the ground. About four or five inches in front of it, on the inside, set your trap, arranging it so that when fully covered with earth the jaws will be level with the firm ground. Be sure that the trap is set with the open jaws extended lengthwise, opening right and left, so the bear will put his foot into it lengthwise. Otherwise his foot would almost surely be thrown out by one of the jaws of the irap squarely upon the pan. The clog to which the chain is fastened should be a short log of sound, heavy hardwood, about six inches in diameter, and this should not be fastened down. If the bear gets away from the set without smashing it up it can be used again. Some trappers place a row of sharpened sticks in the ground on either side of the entrance of the pen to make the bear walk carefully in the centre and step over the cross sticks at just the right place.

Many persons object to the use of traps, and with good cause, since trapping is neither kind nor sportsmanlike. Nevertheless, after a man has made one or two unsuccessful and expensive trips into the mountains for a bear, he finds no difficulty in excusing the use of a trap. And so long as he does not kill deer, mountain goats, bighorn sheep or other game for bait for his bear trap, he need not entirely sacrifice his claim to being a sportsman. After all, there is not so very much difference between bringing a grizzly to bay by means of a trap and rounding him up with a big pack of hounds .- From Recreation.

## WORDS OF WISDOM.

Dispatch is the soul of business ---Chesterfield.

## COMMERCIAL COLUMN. Weekly Review of Trade and Lates: Market Reports.

R. G. Dun & Co.'s Weekly Review of Trade says:

Preparations for fail trade are on a fairly liberal scale, testifying to confidence in the future, and jobbers receive moderate supplementary orders for prompt shipment, while retail sales expand in response to seasonable weather. There is some irregularity in reports from the leading industries, foot wear factories receiving relatively larger orders than textile mills, while the iron and steel markets still feel the unsettling effects of recent reduction in prices. Building operations increase at many points, creating a better demand for lumber and other materials, but there is still a decrease in most comparisons with last year's volume. Mercantile collections are more prompt and money is abundant, despite the continued exports of gold.

Waiting conditions prevail in the fron and steel industry, purchases being limited to immediate needs. except in the case of steel bars that have been ordered by makers of agricultural implements to the extent of 250,000 tons. Numerous inquiries promise to result in considerable business next month. Output of coke is rising at the rate of about 3,000 tons weekly and prices are maintained by an increased demand.

#### The Size of the \$ a.

This refers not to the area of the oceans only, but to their total cubic content. which is reckoned by Edward A. Martin, of the Geological Soclety, at thirty times the cubic content of all the land lying above sealevel. In other words, if all the land of the globe were scraped of down to the level of the sea and thrown into the ocean, it would fill only onethirtieth part of the enormous abyss which is occupied by the waters. According to Lyell, the mean height of the land above sen-level is 1000 feet, whereas the mean depth of the ocean is 12,000 feet. There are mountain peaks which rise as high above sealevel as the depressions of the ocean sink below it, but the average height of the land is slight compared with the average depth of the sea.

Not Worth While. I heard Henry Rogers once tel. of meeting a whaling captain whom he had known as a lad forty years be-fore, mays a writer in the New York Times.
