AGRICULTURAL.

TOPICS OF INTEREST RELATIVE TO FARM AND GARDEN.

WINTER ROOSIN FOR FOWLS. Roosts for winter should be so constructed as to have troughs or boards to catch all droppings and prevent the accumulation of several weeks below the roosts, as is sometimes done. This air at night, the results often end in roup and other diseases to which fowls are especially subject during winter weather. Don't keep chickens without proper cleanliness; it will always prove unprofitable.—Independ-

MILKING MACHINES, There is no practical milking apparatus made or used at present. All attempts to make any such have failed. The cow's udder is hardly such a mechanical contrivance as to become a power except that of the hand of an intelligent person. It will probably be as easy to feed cows by machinery as to milk them in that way. The del icate membrane that lines the milk duots cannot withstand the rough touch and usage of a machine. certain cases, when the milk must be drawn in some other than the usual way, the silver milking tube is the best substitute for the human hand. This is first greased with vaseline or sweet oil and then gently pushed into the test, after the milk has been started by gentle rubbing of the udder. The milk flows from the tube then until the udder is exhausted. - New York Times,

A CHEAP CISTERN. A Pennsylvania farmer tells the National Stockman how he built a cheap cistern. He struck a circle seven feet in diameter and dug down three feet, then another circle one foot less in diameter and dag three feet farther and broke down the sides to a slope then with a five foot circle he went another three feet and cut away again. making the cistern in the form of a jug. The sides and bottom were plastered with cement directly upon the clay, and the top was arched over with brick packed up with sand and cement, and a tile was put in to serve as an overflow pipe about eighteen inches from the top. As the average diameter would be a little more than be planted at the rate of I kernel to six feet, it would require nearly seven barrels of water for each foot in depth

one-half feet deep. His figures for the cost were: Two of the cars may be an advantage. day's labor, \$2; one-half day of mason, \$1; two barrels of cement, \$2.50; 400 brick, \$2.40; total, \$7.90. It has been in use ten years and is as good as ever excepting near the top, where he allowed it to freeze, and the cement cracked and pulled off, which could have been prevented by covering with straw or other material.

below the overflow pipe, over fifty

barrels when the water was seven and

SPRAINS IN HORSES.

No matter how slight a sprain may appear, it should be carefully treated, and the horse given a complete rest. Rest is just the very thing that most owners are unwilling to allow, unless the animal is absolutely broken down and unable to move. A sprain of the tendons, especially if at all severe, calls for a prolonged period of rest, even after all symptoms of lameness have passed away.

The object treatment in the first the ground is dry, if possible, stage of a sprain is to keep down or reduce inflammation and to prevant exudation or swelling. The shoe should be removed at once, before the limb has got so swollen and tender as to make putting on another a matter of difficulty, owing to the scute agony handling gives the animal.

The next thing is a dose of physic, which tends to prevent fever and keep down inflammation-acting magically in this and other cases of lameness. The animal should be secured in a position to discourage movement, and either hot fomentations or cold astringent lotions should be applied con- frost. tinuously. There is, perhaps, some difference of opinion as to whether cold or heat is best, but whichever is adopted must be kept up continuously. For a recent injury, without much swelling and contagion, cold is perhaps preferable, but if there is much pain and swelling, relief is most promptly afforded by hot water.

If slight ameness continues or there clude the air. is thickening or enlargement, it will be the best to blister; indeed, it is made perfectly straight should be seldom had practice to blister after a melted into wax. sprain, as it at least insures a prolonged rest.

Great caution is necessary in taking destroy the seed. the animal into work, and if there is any change of the limb now standing it should be fired,

A case of breakdown means months of enforced idleness, generally permanent deformity, untitness for fast work, and, in some instances, incurable lameness. - New York World.

EXPERIMENTS WITH CORN.

The following summary of experi ments is taken from the Iliinois Experiment Station, Bulletin No. 5:

The tassels on ten alternate rows now. were removed as soon as they appeared.

Seventy-eight samples of corn, with different names, were tested on contiguous plate, each one-fortieth of an acre in extent. For the first time in five years the late varieties gave the largest average yields, nine such varieties averaging 70 bushels. Sixtyseven plats of medium-maturing varieties averaged 68 bushels per acre, and 16 plats of early maturing varieties averaged nearly 53 bushels. For five years past each of four medium-maturing varieties have given yields of

from 71 to 76 bushels per sere.

given in the same time average yields of 65 bushels per acre. For three years past the best yield by any variety was 83 bushels per acre, by Boone County White. The largest yield in 1892 was almost exactly 100 bushels per acre of air-dry corn, of the variety known as Piasa Queen-a variety maturing too late for Central Illinois. The trials for six years indicate that the larger, medium-maturing varieties give the best results. Among these the Boone County White, accumulation means impure breathing Champion White Pearl and Burr White represent the most satisfactory type of white, while the Learning has given the best results among the vellow varieties. The Murdock has given the best yields of any early maturing variety-65 bushels per acre for five Years.

Excellent varieties were obtained from many different places. Extravagant claims, such as yields of 100 bushels per acre under ordinary enliivation, or that any variety worth cultivating matures in eighty or ninety days, when planted at the usual time, machine to be manipulated by any are not to be accepted as correct. In ordinary circumstances 100 days from date of planting may be considered as a minimum for field corn to mature fully; late varieties often need 150 days in Central Illinois. Repeated trials have uniformly

shown that larger yields of both corn and stalks are obtained by planting a larger number of kernels than is customary in the best practice of Illinois. From 12,000 to 13,000 kernels planted per sere seems to be the minimum for largest yields at the station grounds. This is equivalent to 4 kernels per hill, in rows at the usual distance for planting is Illinois. In most of the trials the rows were 3 feet 8 inches apart each way. Twenty-four varieties were planted in as many plats, half of each having 3 kernels and half four kernels in each hill. In 21 of the 24 cases the larger yields were obtained from the thicker planting, the average increase for the 24 plants being about 4.5 bushels per sere.

Repeated trials have shown that, if other conditions are the same, there is no perceptible difference in the average yield, whether the corn is planted in hills or in drills, the number of stalks secured influencing this rather than their mode of distribution. In many cases it is more difficult to keep drilled corn free from weeds. To secure the largest yield of both corn and each three inches in rows 3 feet 8 inches apart. Thick planting gives smaller ears, which increase the labor in husking. Where the corn is to be fed without husking the smaller size

As in each of several previous years, trials in 1892 show that shallow cultivation is better than deep, and that more frequent cultivation than is necessary to keep the soil free from weeds and the surface fairly loose is not profitable.

No noticeable effect on yield was alternate rows.

PARM AND GARDEN NOTES.

Everything green is not good for pasturage.

The smaller a bantam the higher the price it will bring

as a tonic for sick fowls. Horses should be taught to walk fast

until it becomes a habit. Sweet potatoes should be dug when

Detroit Free Pres.

Interesting treasurementigations. In a communication to the Society Medicate du Alle Arrondissement de Paris, Dr. Rosenblith shows that ef fusions of blood in sprains are very apidty reabsorbed by massage. In practice the injured articulation is at irst immersed in very warm water in order to dilate the superficial vessels, after which preparation of the af feeted region massage is performed outside of the injured part: it is ther gradually approached, a very gentle stroke being applied to it at first followed by more vigorous triction, thus gradually producing insensibil ity. When partially obtained a more or less energetic kneading is pursued, secording to the vary ng degree of sensibility experienced by the patient, and to the massage part finally appled a compressive bandige, with wadding, which is wrapped in a flanel or linen band. If strain occurs in the inferior limits Dr. Rosenblith contrary to the ordinarily commended practice of avoiding movements for a shorter or longer period-advises the patient to walk is soon as he can do so without feel ing great pain. Walking, he says adapts the auricular surface in a natural way and actuates the venal and lymphatic circulations by the musmiar contraction.

But It's Her Bright Side.

The inhabitants of this earth have never seen but one side of the moon. The explanation is this: The moon makes one revolution on her axis in produced by removing tassels from the same period of time that sh a hiving once around the earth, whus the same geographical region of the lumar surface is al ways toward us.

With local applications, as they cannot reach the seat of the disease. Catarrh is a blood or constitutional disease, and in order to cure it, you must take internal remedies. Half's Catarrh cure is taken internally, and acts directly on the blood and numeus surface. Half's Catarrh cure is rot a quack medicine. It was prescribed by one of the best physicians in this country for years, and is a regular inconstitution. Catarrh Cannot Be Cured Warm, sweet milk is recommended prescribed by one of the best physicians in this country for years, and is a regular prescription. It is compose to the best tonics known, combined with the best blood parifiers, acting directly on the morous surfaces. The perfect combination of the two ingredients is what produces such wonderful results in curing catarrh. Send for testimonials free.
