ROAD & FARM IMPROVEMENT.

WATERING ROUGH LAND.

Simple System of Irrigation Successfully Introduced in the Arid States of the Far West.

Along the line of many irrigation canals, large tracts of land are often found which have a decided fall, or are rolling. Where this occurs in large tracts, the expense of terracing is generally too great for the average farmer, and a system whereby the distribution of water can be assured which is suited to the contour of the ground must be devised. On land sloping similarly as shown by the plan herewith, the water enters the distributing ditches at the upper left-hand corner, and dividing, flows through these into the still smaller ditches, from which it is turned laterally into furrows. Little dams or temporary obstructions of earth check its flow from point to point. After water flows out upon a field, any surplus is caught by small

SIMPLE SYSTEM OF IRRIGATION.

trenches shown in the figure as trending diagonally toward the right-hand lower corner. From these trenches the water can be turned upon the lower fields so that the excess or seepage is not wasted, but is employed on the less elevated tracts.

Canvas dams are generally employed in checking the waters over the field, as they are most convenient. The following description will enable anyone to construct them, and will also explain their use. The materials used in the construction of a canvas dam are a piece of timber, usually a two by four scantling, long enough to reach across the top of the ditch from bank to bank; a small stick varying in length according to the width of the ditch to be dammed, but no longer than will lie across the bottom of the ditch without leaving any considerable space between the stick and the bottom; a brace or stick about one-third longer than the depth of the ditch and a piece of canvas about one-third wider than the depth of the ditch and as long as the width of the ditch at the upper edge. The canvas is cut into a trapezoidal shape, somewhat resembling but larger than a section of the ditch. The long edge of the canvas is fastened to the scantling first described and the short edge to the small stick. It is well to have a little margin of the canvas below this short stick.

The dam is placed by throwing the scantling across the ditch just below the point at which it is desired to divert the water. The canvas rests in the ditch, with the short stick lying across the bottom, far enough up stream from the location of the scantling to make the canvas nearly tight. The brace is placed with one end against the scantling and the other against the short stick, thus preventing the canvas from being washed back under the scantling.

A little earth is thrown upon the loose edges of the canvas, where it rests against the banks and against the bottom of the ditch, and the water is turned in. The weight of the water presses the canvas against the banks, so that there is scarcely any leakage. In some cases permanent dams with head gates are placed in the ditches, and this is often done where ditches branch and it is desirable to divert the water to one or the other branch.—W. J. Blanchard, in Farm and Home.

Keeping Roads in Condition.

Fred Grundy, in Farm and Fireside, tells us he has been watching "road-keeper" care for ten miles of black earth road, and he has kept it in good condition, not by macadamizing it or by covering it with crushed stone, but by providing good drainage, by tile in most places, to take the water off, and by digging out some of the worst places about 18 inches deep and filling with broken brick, tile, coal, cinders or whatever will make a firm foundation, and allow water to drain through. Then if the roads are rounded up to allow the water to run off and they get a little attention after every rain, they are easily kept in good condition. The results are much better and the cost much less than they were for the annual turnout of the district to mend, or often to make worse the roads, the job being expected then to be done until the same season comes around another year.

Wood Ashes as Fertilizer.

Wood ashes give the best results on pasture land, orchards, small fruits and on clover. To purchase wood ashes is a risk, as it is difficult to procure two lots alike in composition, while exposure to rains may cause loss of potash by leaching. If one has ashes it will pay to use them, as they contain both lime and potash, but it will be found better and cheaper to purchase potash in the forms sold by fertilizer manufacturers than to buy ashes on the market.

CASTORIA

for Infants and Children.

Castoria is a harmless substitute for Castor Oil, Paregoric, Drops and Soothing Syrup. It is Pleasant. It contains neither Opium, Morphine nor other Narcotic substance. It cures Diarrhoea and Wind Colic. It relieves Teething Troubles and cures Constipation. It regulates the Stomach and Bowels, giving healthy and natural sleep. The Children's Panacea—The Mother's Friend.
