### SIMPLE BUTTER WORKER.

For the Average Farmer the Device Here Described Will Give Reasonable Satisfaction.

The proper way of working butter is by pressing, much the same as is required when pie crust is rolled with a rolling pin. It should, indeed, be folded over and over, and rolled repeatedly until done. The reason this is not practicable in the hand working of butter is that more pressure is needed with butter than can be applied with the unaided hand.

Now, for the average farmer, who has only a small dairy, the style of butter worker shown in the accompanying illustration will give good satisfaction, and will be found easy many of the leading cereals grown on of construction. It consists of a

FARM BUTTER WORKER.

long, large rolling pin, in the end of which is put an iron pin that, in turn, is inserted in a hole at the end of the frame, the sides of this being considerably higher than the roller. Thus, by taking hold of the handle at the other end, one can use it as both lever and rolling pin. The roller may be round or six or eight sided, just as is preferred; but it should always diminish in size toward the end furthest from the handle.

As can be seen in the picture, the butter worker is triangular in shape, and it should be about 20 to 24 inches wide by three feet long. If of these dimensions it can be set on the table when in use, the point being over one side and the other end raised a trifle, so that the drip will run off the point. It is much better, however, to make stout legs for it and brace them; the apparatus can be set then where one wants it.

In using it, the lever or roller should be moved right and ! pressed down hard. More or less practice will be required, of course, for a new hand to do extra work, but a m, 110 p m, 130p m 4 57p m, 7 67p for a new hand to do extra work, but judgment, is sure to bring satisfying returns .- Frederick O. Siblev, in N. Y.

## ROPINESS IM MILK.

It Is Council by a Buellina Which Lives in Water and The ba Where Birthle

The slimy, visual condition of units has been a source of perplexity and abhorrence to-all dalrymen and milk dealers at one time or another. It is quite commonly supposed to be alway. due to a diseased state of the unider known as "garget;" but we are told in the last farmers' bulletin from the Cornell experiment station that this is a "mistaken belief." There is a "ropy milk" that is due to garget and may always be known by its yielding on standing a viscid or even bloody sediment. But what the milkman knows as "ropy milk" is not that. This bulletin tells us that this kind of ropy milk contains bacteria known to science as bacillus lactis viscosus. They live naturally in water, and preventive measures are most important. Some are these: Wash and scald the milk utensils after use.

milk utensils after use.

Also leave Sunbury:

Merely rinsing them will not do. Bacteria may be introduced by that very exclassing at Philadelphia 7:22 act. Keep the cows' udders clean.

The floors of all rooms where ropy milk is kept should be disinfected with a mixture of five parts of crude sulphuric acid to 95 parts of water. All milk utensils after use. utensils should be scalded most thoroughly daily. Never let cold water come in contact with utensils unless they are scalded before using for milk again. Exercise the greatest care to prevent even a drop of water from the cooling tank getting into the milk. That occurrence is probably the most common cause of trouble from ropy milk. If water must be spattered about, the cans standing in ice water should be covered. Utensils, after washing and scalding, should stand upside down to prevent the accumulation of dust on the inside .- N. Y. Tribune.

A Note on Winter Feeding. The farmer who has a silo filled with good corn ensilage, a little mixed hay. and some corn in the crib can settle the winter feeding question easily and economically, since all he needs to supplement the farm products is a nitrogenous concentrate, says a correspondent of National Stockman. The feeder who has neither silage nor roots will find it more difficult to deelde in regard to his winter feeding, for, instead of depending upon the laxative effect of ensilage to keep the eattle in good condition, he will be phliged to use some commercial byproduct for this purpose. Of these, linseed meal and bran have this effect upon cattle in a pronounced manner. Although both these feeds are at the present time very high, more or less of one or both of them must be fed, since it is absolutely necessary if the best results are to be obtained to keep milking cows or feeding cattle in a good

BEES AND FRUIT-GROWING.

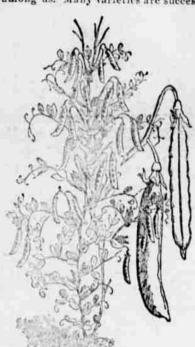

the Value of the Busy Little Insects Cannot Be Overestimated.

The facts in regard to the value of honey bees in connection with fruitgrowing is beginning to show up in plain view. Scientists of late have proven beyond the shadow of a doubt the importance of honey bees in dissom in the orchards of this country. tion that the honey bee is the best agent, and the only one that we can place our best hopes to do the work successfully. Cross pollenation can only be done by insects of which bees are the principal, and self-pollenation is considered not near so successful. The value of bees in this particular h not only confined to fruit-growing but to everything that carries pollen ir the line of fruit or grain, and vegetables also. Those who have made observations in this line can testify to the facts that bees work largely on the farm, and besides this almost every small and weak. vegetable that either furnishes honey or pollen. No insects compare with honey bees in this work. Bees canvass several miles in diameter, and that blight. There is a work as regular as the farmhand, and reason why such a child should ings and later in the evenings. The stay small. Scott's Emulsio: wideawake fruit grower of the present is a medicine with lots time, the up-to-date horticulturists are already aware of this discovery, and strength in it-the kind of provisions are made for the bees so I know of some of the leading fruit-growers who have several hundred acres of fruit orchards in this country, purchasing bees for the sole purpose of fertilization of the bloom the coming spring. This has undoubtedly makes them sleep, makes then been the greatest trouble in returns from orchard growing in the western country owing to the absence of flower visiting insects which are more numerous in the east .- A. H. Duff, in Prairie Farmer.

#### EDIBLE PODDED PEA.

Some Varieties of This Neglected Vegetable Are Really Excellent in Flavor and Texture.

A bulletin of the department of agriculture says that the edible podded pea deserves to be better known among us. Many varieties are success-

EDIBLE PODDED OR SUGAR PEA. fully cultivated in Europe, but here as yet they are grown chiefly by amaes and are hardly in the market. This pear has a very tender pod, the ordinary parchment-like lining being much attenuated. The pod is thicker and more fleshy than the pod of the shelling pea. It is gathered when the pea is just forming and used, pod and all, exactly like string beans. Some varieties tested were found to be ex-

cellent in flavor and texture.

How to Exterminate Anta. Ants are very troublesome in greenhouses and other glass structures, and they so quickly become large colonies that they are frequently worse than a nuisance. We have seen many remedies tried, but there is nothing that so quickly drives them off as a little petroleum poured about their runs and into their nests. We recently saw them thus cleared from an orange tree which was growing in a house. Sufficient petroleum was put into a saucer to just cover the bottom, and in this the orange pot was placed, with the result that in a short time not an ant was to be seen. An economical and convenient way, in some cases, is to attach a sponge saturated with oil to a sharpened stick. This can be stuck in the ground or laid down, and can be removed from one place to another. Absorbent rags will do if a sponge is not available.-Agricultural Epito-

Vegetables Out of Season.

A man well versed in horticultural lore tells the Farmers' Review that most of the fruits and vegetables grown in hot houses out of their season are of exceedingly poor flavor, though they bring fancy prices on the markets. He says: Cucumbers thus grown have the color of eucumbers and the shape of cucumbers, but that is all. The same is true of tomatoes, which have the ruddy cheeks of those grown in the open fields, but lacking almost entirely their flavor. Nevertheless, the real test is, from the fruit grower's standpoint, what they will bring in the market, and judged by that test the growing of fruit out of season is to be encour-

# HE FEARED HE HAD LOST

When Wu Ting Fang, the famous Chin-ese Minister to Washington, irritable and somewhat forgetful from a severe cold, missed one day from the front of his cap the immense diamond he always wears there, he was dreadfully frightened. A friend pointed out that the statesman had inadvertently donned his turban wrong side before, and that the diamond was safe in the rear. Had Wu Ting Fang been wearing a Benson's Porous Plaster on his chest or back to cure his cold, he never would have doubted its location. He would have felt it doing its work,—warming and mak-ing flexible the torpid muscles, extracting the pain and soreness, promoting the free circulation of the blood, stimulating the skin and lungs to proper action, and so dissolving and banishing the malady. Thus we perceive, beloved friends, that

## THE BIG DIAMOND ON HIS HAT

while a pretty thing to look upon, was of no practical use. But Benson's Plasters are supremely useful. They relieve and cure gout, rheumatism, neuralgia, colds on the chest, lame back, etc., so quickly on the chest, lame back, etc., so quickly and completely as to make you wonder how it can be. Better now,—well to-morrow; that's the way they work. Get the genuine. All druggists, or we will prepay postage on any number ordered in the United States on receipt of 25c, each.

ROADS IN PHILIPPINES.

Hampered the Unefulness of a Stone-Crushing Machine.

What has been accomplished by Americans in the Philippine islands is, to a certain extent, attested at Binangonan, on the Laguna de Bay. On a rocky headland jutting out from the Morong shore stands an imposing structure which demonstates what some of our officials are capable of doing.

In the olden days, when the pino desired to repair that portion of the street which lay immediately in front of some grandee's door, if any broken stone was used, the ma-After erecting a mat to screen himself from the sun, the Filipino squatted beside a little rock pile and possibly pounded out a cubic meter of broken stone in a day. But this slow and laborious process of obtaining road material did not entierly commend itself to the American authorities. They resolved to erect a large rock crushing machine, and there was no reason why the projected rock crusher could not be operated very successfully. After discussing the merits of various localities a point near Binangonan, on the Laguna de Ray, was the site selected. After studying the situation, a competent engineer carefully drew up the plans for the proposed rock crushing plant and sent in all the estimates required. These plans were pigeonholed in Manila, and, certain purchases having been made, it was ordered by "he who must be obeyed" that the rock crushing plant should be erected. The plans of the engineer, the estimates and requisitions of a practical man who knew exactly what was wanted were ignored. But a joblot of machinery was assembled and over it was erected a flimsy superstructure which may or may not fall to pieces at any time.

The engine which operates the crushing machinery originally came from England. In design it is certainly unique. And its actions are eccentric. Attached to this masterpiece are two boilers, which at the outset were said to be ridiculously inadequate. If carefully nursed these boilers will safely earry 80 pounds of steam and supply power enough to run at slow speed one of the two rock crushing machines.

Although not of the latest modern or of the most approved form of construction, the two rock crusher are of American make and capable u. doing good work.

The genius who constructed the erushing plant bit upon the bappy plan of having the stone run down hill to a platform considerably below The Pahson-Dis am most postively the hopper of the rock crusher and from there shoveled up again. The placing of the rock crushers also vokes attention. If the ingenious Brer Jackson-Yes, sah, pahaon; dat builder nimed at securing a maximum of economy he is to be congrutbaying accomplished his purpose. Both machines are placed askew, almost at right angles with their proper positions, and matters are further complicated by baving several things turned upside down in the arrangements for transmitting the power. Neither can the pullies nor belting escape observation. Wooden pullies are used-lopsided affairs that writhe and squirm-and in stretching and destroying belts they are found to be quite effective. So great is the loss of power that, although in the theory the two bollers should furnish ample steam to run the two machines, one of the rock erushers from necessity is always

The miniature railroad track, over which are wheeled the tiny cars of crushed rock, is not laid as it should be, and the arrangement for loading crushed stone into cascoes involves double the amount of work that would be required were things ar-

ranged aright. Launches may tie up under the shadow of the crushing plant, and to obtain water from the lake should be no trouble at all. But for want of a suitable piece of pipe with which to make connections, whereby water might be pumped by the engines into the boilers from the lake, four hombres were formerly employed at one peso each per day to carry water for the engine. The present foreman of the plant arranged to dispense with the services of three water carriers, but the government is still expending a peso a day because of somebody's disinclination to buy for the plant an inexpensive plece of

Once upon a time the foreman of the crushing plant made requisition through the usual channels for a draw shave, a medium sized cold chisel and an ordinary barrel. (It was set forth in the requisition that any old barrel capable of holding water would serve.)

But instead of the things asked for the foreman eventually received a communication from Capt. Dodge stating that samples of all articles requisitioned for must be forwarded to the purchasing agent before any purchases could be made. As the foreman had neither a draw shave, a chisel nor a barrel to send to Capt. Dodge he is still unsupplied with these articlas.

And so it goe. at Binangonan. Owing to defective construction and ineffective machinery, the output of crushed rock is less than half what it ought to be under proper conditions .- Manila (P. I.) American.
