dead robber as that of William Bay, rises up and denies it.

It is currently reported that when the Republi an Standing Committee meets in Middleburg Jan. 31st, there will be an effort put forth by few interested candidates to spring an early primary. For the past several years the evils of snap primaries were seen only when it was too late. The Posr has no ax to grind, but in the name of justice, we warn the republican voters what is proposed and if they approve of primary campaigns of two, three and four weeks' notice, they will of course be content. We know, however, that the majority of the voters do not approve of this and it would be well for these to express their opinions to the members of the Standing Committee from their respective districts. Two or three weeks' notice may be long enough for men who know a year ahead that they will be candidates, but it is not long enough for a man who is undecided even at this time whether he is going to be a candidate or Now, Varner, the name whom the Thompson- not. If the voters desire to avert a snap prim

J. G. Chesnutt of Sunbury announces his candidacy for Chief Burgess of Sunbury. He has inaugura'ed the unique though commendable platform, that political office should be a gift and not a purchase. He proposes not to spend a cent for anything and desires to make a test of this lofty ideal in the political scramble for office. Nothing wou d change our opinion of the morality and character of a town like Sunbury as muc's as the nomination and election of Mr. Chesnutt on a plaform of such commendable principles. A victory for Mr. Chesnutt on such a platform will certainty enhance the reputation of Sunbury for uprightness and a high degree of morality.

Most of the townships and the boroughs of the County will hold their primaries within the next few days to nominate candidates for tle various positions to be filled at the coming Spring election. See to it that your best men are

STEAM IN THE SILO.

Oregon Experiment Station Tests Favor the Steaming of Ensilage, in Certain Conditions.

Nearly 20 years ago, when silage was an uncertain quantity, a student at an fully handled that there w agricultural college suggested running | necessity for doing the thing a jet of live steam in at the bottom of a cement silo. The argument was that II this has not been done bef this would cook the silage, and, if the gin some weeks before calving silo were then tightly closed, give it iliarize the heifer with the just about the conditions under which Stroke her, caress her, hand fruit or vegetables are canned. This suggestion was laughed at as absurd, chat any advance in the pr From time to time we have seen re- be unnoticed by the animal ports of the use of steam for preserv- a few days the udder can be ing stock food. In one case an English at will, and the heifer will so farmer had a quantity of musty or damaged hay. It was packed into a small barn-all the cracks and holes done there will be no trouble being closed. A pipe was run inside at the bottom of the hay, and steam forced in under powerful pressure. This was kept up until the steam escaped at the top. The result was that

DEVICE FOR STEAMING SILAGE.

decay of the hay was prevented so that

Now we find in Bulletin No. 72 of the Dregon experiment station (Corvallis) an interesting account of steaming silage. The silos, made purposely for the experiment, were constructed of well seasoned yellow fir dressed tongue and groove lumber 1% inch thick, 31% inches wide and 12 feet long. When completed the silos measured approximately five feet in diameter and 12 feet deep. They were constructed plain, having no doors, so that the only way of filling and emptying them was by way of the top of the silo Five such silos were constructed; two of them, Nos. 1 and 5, were fitted with 1/4-inch piping so that they could be

The picture clearly shows how the steam pipes were connected. In one ease the steam was delivered near the bottom only. The other was fitted "so time. that steam could be liberated in the silo within two inches of the bottom at G. and also midway between the bottom and top at F. The upright pipe EF in the silo was covered with a cap at F so as to prevent fodder from falling into the pipe. Ten to 15 holes three-eighths-inch in diameter were drilled in the pipe near the cap at F as outless for the steam. The elbowat G turns directly down and comes to within about two inches of the bottom of the silo. This elbow G prevents material from getting into the pipe GH, and serves as an easy outlet for the steam when forcing it into the silo

The corn cut into these aims was so that each silo contained a little over three tons. Steam was introduced untemperature rose to 212 degrees. Then the top of the silage was covered with per cent. When opened there was some sweet-"with the odor of cooked sweet chemical change as the silage put up

WHOLESOME ADVICE.

When Long-Keeping Butter Is Desired It Should Be Washed in Sterilized Water.

The keeping quality of butter depends very greatly on the water in which it is washed. If the water looks clear it is generally supposed to be pure. But the miscroscope has shown that the water that looks as clear as crystal is frequently the abiding place of disease germs as well as of ferment germs of various kinds. We predict that the time will come when butter made in our first-class creameries will be washed in sterilized water. There have been numerous cases where butter made under highly scientific conditions has gone off in flavor in a short time and subsequent investigation has shown that the apparently pure water in which it was washed was the cause. In the home of the farmer the well is usually depended on to furnish water for washing butter as well as for other uses. Too often the well is dirty from different causes. We have seen such wells where the water actually was odorous with decaying animal life. Yet after the water became tainted it was still used for weeks by the family. One such well, on being cleaned out, was found to contain great masses of dead angleworms. It ed. Even when nothing of this kind ter for the farmer to boil water used for the washing of butter. This is advisable certainly when long-keeping in some degree. It has been shown that more not to keep her supplied .- Doeven in butter typhold fever and other tothy Tucker, in Farm Journal. disease germs have been carried .-Farmers' Review.

RICKING CORN FODDER.

Where Barn Room Is Not Adequate for Storage.

fodder, and a very good one, is to set common fence posts on the side or top of which, according to the height of the corn, spike one or more poles. Set trade of this place held a meeting, and the corn against these, making a long on each side of the poles, if the last rows of sheaves have been set with a pretty flat angle, you will be able to place another row of sheaves with the butts about on the bands of the last row of sheaves (as shown in fig. 1). In this way you will have a narrow. rather low stack, but the sheaves will be set at such an acute angle and the middle will be so supported by thepole that the fodder should not be injured

PRESERVING CORN FODDER.

by rain. In feeding, begin at one end of the rick so as not to disturb the top sheaves of the entire stack or rick A little skill in placing the second, third or fourth tier of sheaves on top of the first ones will result in a satisfactory method of preserving the stalks till wanted. Do not get the base of the stack too wide or it will have to be carried two high to get a top on it, or the top will have to be quite flat. Sometimes a long line of posts is set and provided with poles as already stated, and the shear's or stalks are set nearly or quite as upright as they are when shocked in the field. About four or five tiers, more or less, of sheaves are placed on each side and no effort is made to put a top on the rick. The only trouble which is likely 'o arise will come from very deep
