THE MINE REPORTS.

Inspector Stein Forwards His Report to the State Department. Do you wish to cat Mr. William Stein, or town, Mine Juspen-candy that is pure? If so, you restor the State Authrenite, District, to-day should try our new line. We completed bisaning report to the stafe defined by A. M. Tenney's chocolutes is riment and forwarded it, but before doing sa kindly allowed a Harahn eporter to make a few notes of a me of the most im-portant parts of the decoration. In his prefere to statistical enumerations in the report the Inspector engal. The condition of the religious in the Sixth

flyrrica is very entisticatory and are in avery existrator yearly improving. We have put The number of second autieta are not con-fined to the requirements of the Mine Ventifation Law, for it is not an uncommon thing to have 3 and 6 outlets 'e most of the col-Beries. Additional face have been built at some of the collicies, and the maltary condilion of the mines throughout the distric-his been much improved. The method of mining the coal value has met with the approval of all the mining experts, who have violed this district. In constructing the collectes to their limit only, thirty to forly per cont. of the cont vein is mined and sent to the surface, the remaining 60 to 70 per cont. Is left in the shape of prior supports, and final religing to begin. Echbing the pillars mean that all the cont is taken from

them which can be practically gut, providing the surface conditions will warrant it, but surface improvements, rrecks, tailroads, water dams and swamps interdiately exer-lying the suscept of the cent beds prevent large quantities of cost from being mixed.

The width of the pollers are almost univer-sal and are trom 10 to 12 yards wide on all gles of dip; not so with the width of breasts of the vein itself, and the over and underly ng stata, and these characteristics are a racied to course of constructing a gangway, that to continue of the same with the bready can be worked six, seven and eight yards wide, while in other sections the breads have to be driven narrow and doubte thinkered with an eight foot collar. The breads are opened in groups of ten (10) with a large reservation pillar ferming the position of two breads and two pillars between each group. This method we believe not only increase the general safety of the colliery, insumer as each group of breasts can be ventilated aparatory, which gives a pater and localities atmosphere for the workmen to breathe, because the impurities from combustion and otherwise are dis-

charged directly into the units return air-way from each group. Not only so, but should an explosion of gas occur, the effects group of breests in which the orphosior occurred. This method of mining also de creases the costs of main maing the trancreases the costs of nonlithing the trans-partition and alreavenors, and also should a fire occur in a group of breasts, it could be fought directly, and if necessary to flood, it would not be necessary in submerge the entire colliery. We also claim from an economic standpoint that unuing cost by the breast and pillar system, as above described, that the operation can take more coal out to a given area from the fact, in the event of final robbing the nillars laying been formed anal robbing the pillars having been formed sufficiently large and strong enough, that should a squeeze or thrust take place it will only effect that territory being robbed and the squeeze would only be local. There are dangers to be encountered in min-ing operations, over which we have had no

control as to their existence, and we believe every effort is being put forth to provent loss of life from these daugers, so far as it is possible for human skill to conceive. For inin fact the only effectual remedies, in fact the only effectual remedies in many under high pressure in the coal strata, and out the country. If you are afflicted consult which in course of mining the coal has him. You can consult Dr. Greene personally been suddenly liberated, causing loss of life.

To guard against accidents from sudden out.

33 West 14th St., New York City. He has delighted from the course of the country of th opted in some of our gaseous mines to tap, possible, the gus in advance of the coal possible, the gas in advance of the coal of overwork, excesses and all diseases of the co, and yet notwith tanding all the foreought exercised and care taken to discover practice. A cure is practically certain. them dangerous quantities of gas, sudden out-bands of gas do occur, although not frequent

leavings, but all the Newest, coal vein and the intervening rock measures "one person of literary and scientific Freshest and Most Desirable between the top of vein and bottom of "put acquirements and skill and experience in the Attire cannot of producing consudden burst of and and water takes place, to fill the unexpired term of Prof. C.
