Marketing Early Potato-s.

To those who are unfamiliar with potato growing, the high prices which early potatoes command might seem to make it an object to dig a large part of the crop and market it while the price is up. But there are several drawbacks marketing potatoes early. The weather is hot, and while the skins of potatoes are tender, they will rub off their jackets if handled freely, and the potatoes are then almost sure to rot. Hence they are never sent far or in large quantities. In digging potatoes early there is great waste, as only a few of the largest are of marketable size, and those that will sell would grow still larger if left a few days longer in the hill.

How Much fle'd Be Missed.

"Henrietta," said Mr. Meekin, "do you think you'll miss me?" She looked at him in surprise and jueried:

"When?"

"When I have gone to war."

"Mr. Meekton," she answered, "I have had reason for resenting a great many things, but I am willing to own that if Spanish marksmanship is such that you are missed in the war as often as I will miss you at home there won't be any risks for you whatever!"

Origin of Goldfish.

Goldfish are of Chinese origin. They were originally found in a large lake near Mount Tsientsing, and were brought to Europe in the seventeenth century. The first in France came at a present to Mme. De Pompadour.

The new British battleship Implacable is to cost over \$5,000,000, the largest sum ever spent in the building of a The armor plates alone man-of-war. will cost \$750,000 and the guns nearly

Although spraying destroys fungus growths, it seldom does so in time to make a successful growth of fruit the first year it is tried. The leaves are more or less injured and this makes them unable to perfect the fruit. If fungus growths have been the work several years they have probably to some extent impaired the vigor of growth of the tree, and there will be less blossoming or setting of fruit from the blossoms until the injury has been remedied.

Guinea Fowls on Farms.

Every farmer ought to have a few minea fowls to add to the variety of feathered life on the farm. They are also a good protection against such depredators as hawks and other enemies of young chickens, their loud cries on the approach of any such intruders giving signal to the weaker fowl to make its escape. Guineas are a rather wild fowl and will not bear confinement well. It is not best to keep them unless there is good range. The hens are great layers, but will mostly steal their nests and will bring off very large broods. The young guinea fowl are very hardy and not so subject to disease as are other fowl.-American Culsivator,

Preparing the Soil for Fall Wheat,

Wheat following potatoes generally results in a heavy crop, and as the price of wheat will probably remain a: paying figure for some time the ground now in potatoes may be profitably used for wheat in the fall. If the potatoes have been well enlitvated no additional preparation of the land will be necessary for the wheat after the potatoes are dug, with the possible exception of going over the ground once with a smoothing harrow.

Doubtless the best preparation of the soil for a wheat crop is to turn under a clover field, grow potatoes on it, and follow in the fall with wheat. The cultivation of the potatoes will put the soil in good condition for the wheat, which will receive the benefit of the plant food in the clover from the moment the seed wheat is put in the ground.

Washing Milk Vessels.

All through the warm weather, paricular care is needed to cleanse vessels that have contained milk. If any particle of milk is left in the crevices or corners of vessels, it will sour and affect any milk that is afterwards dded. Many people in cleaning milk from vessels wash them first with scalding hot water. This is a mistake. The hot water only coagulates the alonmen, causing it to stick more closely to the sides of the vessel. If it be of tin the sconring of the milk soon eats through the coating of tin, and causes rust on the iron beneath it. What we call tin is merely iron with a very thin tin coating. No such vessel is fit for long use, as the tin will wear through, and all the more quickly if the congulated albumen, made by hot water and milk, requires hard rubbing to remove it. The right way to clean milk vessels is to rinse them well with cold water, and then seald them, to destroy any germs that the cold water may have left.

Managing a Swarm of Bees,

Swarming in a moderate degree will not affect the work of honey making. but usually one swarm from a hive should be all that is necessary for season. Swarms can vest be handled by a homemade swarming box, which is simply a light box of convenient size with a handle running through both ends. A cover should be provided for fastening over the top when necessary and a few holes made in the box for ventilation. When the bees swarm keep quiet until they alight in a convenient place, then hold the swarming box under the cluster, shake off some of the bees into the box and most of the remaining ones will follow. Take the box of bees to the hive. which has been previously prepared for them, shake out a few at the entrance, and the rest will follow them into the hive. Small portions of the swarm may have clustered away from the main body, and all these should be gathered so as to make sure of the queen bee, which must be in the hive or the bees will not stay .- Atlanta Journal.

tato this poisonous principle is developed by sunlight. Green potato tops are poisonous to a certain extent, and the tubers, when they are greened by exposure to sunlight, are so aerid and bitter that it is impossible to ent them.

But in modern growing of potatoes the set is or should be planted from three to five inches below the surface. If it is hilled up at all the hilling should be done before the potato is up in the process of covering. The ridges thus made ought always to be leveled before the potatoes are up. After this is done the best way to cultivate potatoes is to run the cultivator through them twice a week, after every rain, but only to the depth of an inch, or if the weather is dry, even less than this. Shallow cultivation does not disturb the roots, and and can be continued even after the vines are large enough to lop over and cover the ground between the rows. While all the surface soil may be dry, that beneath it will hold enough moisture for the growing potatoes. --- American Cultivator.

Flowers of the Yard.

How much the beautiful flowers brighten up a home. Even a small bed of pinks or asters or garden petunias will give a farmhouse an air of refinement and make it look, as one tittle maiden said, "as though some-body lived there."

One of the prettiest screeus that I ever saw was a bed of old-fashioned morning glories. There was a space about ten feet in length, between the clothes-line post and the "big gate" post. This was spaded up, making a long uarrow bed, and planted with morning glory seed. Wires were stretched across from the tops of the posts, and carpet warp strung from this wire to the ground made a suitable support for the vines, where they ran riot, their dark green leaves forming a beautiful screen, that every morning was covered with the sweet, bell-shaped blossoms in which the red, white and blue of our nation's colors were represented.

This bit of beauty cost 'but a small amount of time and labor, but gave a large amount of pleasure not only to those whose home it adorned but to all who passed that way, especially in the morning. The people who lived on the next

farm "did not have time to fuss with flowers," but they spent time enough admiring these morning glories to have cared for some some of their very own. When fall came they were presented with a gen-tions summly of soul of each other. erous supply of seed of each color, but whether they use them or not remains to be seen. The plants were protected from the ravages of the hens by a network of brush laid over the bed.

If one really wants some flowers and must have the hens about, a few light brush, if carefully laid, are a good protection until the plants are large enough to protect themselves.

Last summer I saw a large dry goods box placed in a yard, filled with soil and bright with beautiful blossoms.

The hens "got a notion" of gimping, or flying, on to the edge of the box and then revelling in a dirt bath when the plants were small. A piece of lath was nailed at each corner of the box and some fence wire was fastened about five inches above the top edge of the lox and this baffled the hens. The plauts grew and throve and delighted the hearts of all who -Lillian McIntosh in Farm, saw them. Field and Fireside.

Late Cultivation of Potatoes.

It used to be the rule with potato growers never to cultivate after potatoes are in blossom. It is then that the earliest tubers begin to form and the deep cultivation of potatoes at this time so disturbs the roots as to stop the growth of the first set of potatoes. Hence the old way of growing potatoes was to give a more thorough cultivation than ever the last time just before the potatoes blossomed. In doing this the soil was drawn from the middle of the rows towards the pota-toes. This was called hilling up the potatoes, and was almost always sup-plemented by drawing the loose soil still closer to the hill with a boe.

No matter how easily this was done, the potato roots thus mutilated never fully accommodated themselves to their new conditions. The roots inside the conical hills would not admit much water, the potato vines died down before the potatoes became very large. Worst of all, as the hills were washed down by rains many of the potatoes were exposed to the sunlight polatoes were exposed to the sunlight and were turned green. This entirely destroys their value for cooking. Green polatoes are not only bitter, but are even , poisonous. It is not generally known that the polato be-longs to a plant family most of whose members are poisonous. In the po-

layers. It is well to feed a mash to the

chickens.

Beans make a very excellent food for the hens.

When hot weather comes stop feeding corn to the poultry.

A good cheese may be known by its firm, yet mellow, touch.

It never pays to keep any farm stock after it is past its prime.

When ice is difficult to obtain, milk and butter lowered into a well will be much improved in keeping.

A few hours spent in draining a low spot may allow a field to be worked than it could have been unsooner drained.

Where milking is done without a calf, a little feeding every evening will improve the coming-up qualities of milk cows,

Gooseberries do well in part shade, and are often grown between the rows of trees in young orchards. In form, they can be trained like a tree or a bush, but the bush shape is preferable.

Every crop, if it is consumed on the farm, has two values—its feeding value and its manurial value. The man who neglects the latter will find in time that he has neglected the more important of the two.

Suicide in Japan.

Hari-kari is a Japanese word for sui-cide by disembowelment. This horrid practice formerly prevailed among high officials and members of the military class when unwilling to survive some personal or family disgrace, or in order to avoid the headsman's sword after having received seutence of death. By committing hari-kari the culprit cleared his character and his family was not disgraced. In the latter case the act was performed in the presence of witnesses, and was ac-companied by elaborate formalities. At the moment the suicide ripped open his abdomon with his dirk his head was struck off by the sword of his second, who was usually a kiusman or intimate friend. Hari-kari was first instituted in the days of the Ashikagu dynasty, 1385-1568 A. D.
