Mrs. Hoffman Describes How She Wrote to Mrs. Pinkham for Advice, and Is Now Well

DEAR MRS. PINKHAM:-Before using your Vegetable Compound I was a great sufferer. I have been sick for months, was troubled with severe pain in both sides of abdomen, sore feeling in lower part of bow-

els, also suffered with dizziness, hendnehe, and could not sleep. I wrote you a letter describ-

ing my case and asking your advice. You replied telling me just what to do. I followed your directions, and cannot praise your medicine

enough for what it has done for me. Many thanks to you for your advice. Lydin E. Pinkham's Vegetable Compound has cured me, and I will recomend it to my friends. - Mrs. FLORENCE R. HOFFMAN, 512 Roland St., Canton, O. scribed by Mrs. Hoff man will appeal to many women, yet lots of sick women struggle on with their daily tasks disregarding the urgent warnings unt? overtaken by sctual collapse

The present Mrs. Pinkham's experience in treating female ills is unparaleled, for years she worked side by side with Mrs. Lydia E. Pinkham, and for metimes past has had sole charge of the correspondence department of her great business, treating by letter as many as a hundred thousand ailing comen during a single year.

Dr. SETHARNOLDS

### PARA-AAAA-AAA FOR FARM AND GARDEN.

Peach Vellows.

The symptoms of the destructive contagious disease known as "yellows" in peaches are stated thus by the Ohio

Premature ripening by from one to ix weeks, of fruit which is high colored and spotted and has the flesh marked with red.

Premature development of winter buds in the formation of short shoots or clusters of narrow, clougated leaves. This growth is very conspicuous where the old leaves have fallen from the present year's growth.

Growth of shoots from adventurous bads on the trunk and larger branches of the affected trees.

For the present season general yellow color of the trees, with peculiar backward folding of the leaves and general premature dropping of the folinge.

The remedy is the prompt removal of affected trees, root and branch, and burning them as near as possible to the point of removal. Dragging the affected trees through the orehard is not advisable. - Connecticut Farmer.

When a cow has thoroughly formed the habit of kicking when some one approaches to milk her she had best be fattened and turned over to the butcher. It seems a pity too, for it is always the best milking cow that acquires this habit. It comes from the fact that the best milker has always, before her bag is milked dry, a very full tension in it, which is painful if not extremely carefully handled. Sometimes the cow is injured by the calf butting the udder, as instinct teaches it to do to make milk come faster. A good careful milker for the the young heifer is therefore better than the calf for starting the milk, though the calf should be beside the cow at the time, so as to prevent her from kicking. It is astonishing how much butting the cow will stand so long as it is done by her own calf. The profit from any kicking cow is never great enough to compensate for the injury such an one may do to those who have to be about them. Usually, too, if left to hired help the kicking cow arouses anger, which is apt to be visited on other animals so that soon others will be spoiled as the original kicking cow had been. venting the kicking habit by uniform kindness is better than trying to cure

Running an Incubator.

The bardest thing to learn in running an incubator I found was how and when to apply moisture. It requires careful judgment on the part of the operator. The amount and time of application depend upon the kind of machine used and the place it is used in.

Nature provided the egg with an over amount of water so that too much would not be evaporated from it during the time of incubation and destroy the developing embryo. If too much or too little of the moisture is evaporated it will be detrimental to the chick.

In some machines the use of moisture is needed more than in others because the ventilation is more rapid in some than in others. If the exchange of air in the egg chamber is carried on rapidly it takes moisture from the eggs rapidly and vice versa. If not enough moisture is taken from the egg the chick will be too large to turn in the shell and therefore dies when ready to pick its way out.

I found that I had been using too much moisture so I tried a hatch without any until the last two days. My success was better than before.

There are several ways of applying moisture. One is by sprinkling the eggs at certain times, another is to place pans in the incubator with warm water in them, and another is to put a dampened sponge in a dish in the egg chamber. Some machines are so built that all air that passes into the egg chamber must pass over the water placed for that purpose. I never used that kind, but I believe it is a good way.

My rule is to not use any moisture until the air space of the egg occupies about one-third of it. Then I supply enough to prevent the chicks from losing any more. Then when the chicks begin to hatch I supply all that I can so that the membrane of the egg shells will not become dry and tough. I am always careful not to open the incubator until the hatch is over, for a sudden draught will easily chill the young chick and it dies in the shell .-P. W. Hearn in the Epitomist.

Making a Log House,

It is not very difficult to build a comfortable log house, and if the farmer has plenty of time he can do most of the work himself. The only tools necessary are a small bit, an inch auger, a common ax, a broadax and a sawing kuife. Flatten the logs somewhat upon each side. Iu building up, place the small end of the second log above the large end of the first. This will keep the top of the wall level as it goes up. When the height of the first story is reached, put on a couple of specially large logs upon which place the crosspieces, notch these in and flatten them on top so that the next log in the wall will fit over them nicely. Keep on building up until the height of the second story is reached, then put up the gables and

prepare for the roof.

The last side log should be about two feet longer than the other, so as to extend beyond the buildings one foot at each end. Put up the poles to be used for the gables, notching each into the upper main log, and three

feet up from the top log of the wall place a heavy pole, the same length as the top logs. Three feet above this place another, and so on until you Then put on the ridge reach the top. pole. Rough shingles or clapboards four feet long can be made from timber in the woods and used for covering. This finishes the roof. Complete the ends of the building by nailing heavy pieces reaching from the inside of the wall to the first rafter. To this secure the timbers for filling in the gables of the house. After this is done, mark off the doors and windows, saw them out and pin or spike casings on each side to hold the log in place.

Chink up the cracks with small pieces of wood, driving them in so as to fill all large spaces and leave no ends projecting. With good mortar fill in the small spaces. If lime can not be obtained a mixture of sand and elay gives good results, but is not so eleanly as the mortar. In an old house which I first built when I came to this country I found it almost impossible to get this out after it had been in over a year. I believe it would have remained until the present time if I had not disturbed it. house can be made of boards or slab puncheons made level and smooth on the upper side and fitted down nicely. If long logs are scavee, short ones can be used where windows and doors are to be made. It takes a little more time to fit these in than to use long lows and then saw out the openings. but it is much cheaper. - Edson Gnylord in Orange Judd Farmer.

Fattening Home Grown Lambs,

In city markets there is frequently some difficulty in disposing of very fat sheep, buyers contending that they are too fat and even going so far as to say that a high degree of fluish cannot be produced in sheep without overloading them with tallow. The Miunesota experiment station holds that this is not true, and inaugurated an experiment to demonstrate that the most perfect finish can be made without undue fattening, provided the foods are suitably chosen, suitably blended and suitably fed.

With this in view a lot of lambs were selected, all of which had been bred upon the farm. They were kept upon pastures other than grass, such as winter rye, peas and oats, corn, sorghum, rape and cabbage. While they were pastured in this way, they were not fed grain. They were late March lambs. The sires were pure bred Dorsets and the dams common grades with a sprinkling of Merino blood. As a rule they were of good form, but not of the highest blocky type. They were fed in a shed and had access to a yard at will. food consisted of oats, bran, barley and oil cake in the proportion of three parts oats, three of bran, three of barley, and one of oil cake, by weight. Hay and roots were fed freely, the roots consisting of carrots and mangels. The lambs were given what they would cat up clean of grain and feed and a fairly liberal supply of roots.

During the 112 days of the experiment the average amount of food consumed per day was as follows: Grain 2 1-1 pounds, key 0.9 pound, roots 1 3-4, or a total of about 5 pounds. The feed was charged as follows: Bran 36,50, oil cake 14 cents, corn 18 cents, buriey 16 cents, oats 14 cents, native hay 3 cents, roots 4 1-2 cents per bushel. The average increase per animal per month was 11 pounds These were excellent gains for so long a period; and notwithstanding the length of the feeding period the gains were as good at the closing portion as at any other time. The cost per 100 pounds of increase was \$3.41. The The lambs were sold in the St. Paul and Minnesota markets for \$5,50 per 100 pounds, shrunk weight. The ment was tested, and the unanimous verdiet of competent judges was that it was of the highest quality. The proportion of lean to fat was unusually large and the blending of fat and lean was perfect. The meat was as tender and juice as that of spring lambs. The value of each lamb when the experiment began was \$3.15, and when it was closed \$7.08, or in other words, the value had been more than doubled during the feeding period. The net profit of \$2.43 per lamb was of course unusual. Feed during 1897 when this test was made was very cheap and it is doubtful whether this result can be equalled again, but the fact remains that home grown sheep can be well fattened and produce the highest class of meat.-New England Homestead.

Poultry Pointers.

Find out the best layers, the best all round and desirable hengand hold on to them for breeders year after

Bad luck has not as much to do with ill success in raising chickens as poor fences, prowling cats, dogs and rats and poor management.

A chick which has been thoroughly wet and chilled might as well be killed. It has been robbed of its vitality and will never amount to much. Hens shut in comparatively close

and their flesh will be sweet and juicy. This makes a very desirable selling Don't think that pure bred chickens need to be crossed to make them better. If you are not satisfied with the kind you have or the number of eggs they lay, dispose of them and get some

quarters and fed on corn or corn meal for two weeks will become very fat,

other standard variety. Experiments have shown that a variety of food for laying hens is better than the best balanced ration withont variety. The right proportion of food for laying hens has been ascertained be about 60 per cent. grain, 15 per cent. meat and 25 per cent.

Fifty.One Bridges for B. & O. R. E. One of the largest bridge contracts that has been awarded in many years has been let by the Receivers of the Baltimore and Ohlo Railroad. In order to place the Hues west of the Ohlo river in proper shape to handle the heavy freight equipment that is being used east of the river, the Receivers found it necessary to rebuild 51 bridges between Benwood, W. V., and Chicago. That the structures might be rapidly pushed to completion it was debetween Benwood, W. V., and Chicago. That the structures might be rapidly pushed to completion it was decided to divide the work among three companies. The Youngstown Bridge Company, of Youngstown, will erect 31 bridges on the Central Ohio division between the Ohio river and Newark, Ohio; The Pencoyd Bridge Works was awarded the 11 bridges on the Luke Erie division, Newark to Sandusky, and the Edge Moor Bridge Company, of Wilmington, Del., will erect the 9 bridges needed on the Chicago division. The total cost of these bridges is in the neighborhood of \$300,000, and it is expected that all will be in place by September. Nearly six thousand tons of steel will be needed for the structures.

A Beauty of the Arctic. There is a beautiful bird called the rosy gull, very few specimens of which exist in any museum, and whose entire life is spent in the immediate neigh-borhood of the eternal ice that surrounds the north pole. A paper de-scribing these curious birds was read at the recent meeting of the American Association in Boston by Mr. John Murdoch. They follow the advance of the ice towards the south as winter comes on, keeping near the loose edge of the floating pack ice, and then retreat with it toward the north when the summer sun begins to rise high upon the Arctic circle. The bird is small and of a deep rose color, whereas all other gulls are white.
