# **MER HUSBAND'S BEST HELPER**

Igorous Health is the Great Source of Power to Inspire and Mncourage-All Woman Should Seek It.

One of the most noted, successful and tichest men of this century, in a recent article, has said, "Whatever I am and whatever success I have attained in this world I owe all to my wife. From the day I first knew her she has been an inspiration, and the greatest helpmate of my life."

To be such a successful wife, to re-tain the love and admiration of her husband, to inspire him to make the most of himself, should be a woman's

constant study. If a woman finds that her energies are flagging, that she gets easily tired, dark shadows appear under her eyes, she has backache, headaches, bearing-down pains, nervousness, irregularities or the blues, she should start at once to build up her system by a tonic with

to build up her system by a tonic with specific powers, such as Lydia E. Pink-ham's Vegetable Compound. Following we publish by request a letter from a young wife: Dear Mrs. Pinkham: "Ever since my child was born I have suf-fered, as I hope few women ever have, with in-fammation, female weakness, bearing-down pains, backache and wretched headaches. It affected my stomark so I could not enjoy my meaks, and half my time was spent in bed. "Lydia E. Pinkham's Vegetable Compound made me a well woman, and I feel so grateful that I am glad to write and tell you of my

Made me is well womin, and reli you of my marvelous recovery. It brought me health, new life and vitality."--Mrs. Bessie Ainsley, 611 South 10th Street, Tacoma, Wash. What Lydia E. Pinkham's Vegetable

Compound did for Mrs. Ainsley it will do for every sick and alling woman.

If you have symptoms you don't un-derstand write to Mrs. Pinkham, daughter-in-law of Lydia E Pinkham, at Lynn, Mass. Her advice is free and elways helpful.

number will settle and stand perfectly straight, there are always shocks here and there that twist or fall down. If these shocks are permitted to remain until the field of corn is gathered, the fodder will likely be entirely ruined. a few showers will make the fodder worthless. Even the corn may be badly damaged in the down or twisted shock. Haul in such shocks as soon as possible, when they are dry. If they cannot be hauled in, then reshock them in the field. After considerable time and labor have been spent in harvesting the fodder, it is certainly not wise to lose even a small percent of it that might easily be hauled in. It is not likely that shocks standing straight one month after harvest will twist enough to damage by rains until they are sufficiently dry to shred or haul to the barn. As soon as possible the fodder should be in the dry. A wet fall very seriously injures the feeding value of cornfodder. Oftentimes Octo-

ber and November are good months for shredding and when December comes, rains early hinder the work. More attention must be given to

orn not entirely out of the sap than to dry corn. Usually such corn has a appy cob and if thrown in a heap the silks and shelled corn in the centre of the heap prevent proper ventilation and fermentation sets in. In this way the corn may be badly damaged. A tight crib is more likely to have corn heat and damage than an open one. The V-shaped trough with pigeonholes in it is a good ventolater. These troughs are made to fit crosswise in the crib at irregular intervals, especially near the place of filling the crib. This permits the free circulation of air through the heap. If troughs are not used ordinary fence rails crossed occasionally will permit air to pass

through. Where shredding is practiced the helled corn is difficult to handle bemuse of its tendency to heat. It must be made free of cut stalks and dirt. Then if not too sappy it may be spread and stirred two or three

times. Then it will dry .- W. B. An-

derson in the Indianapolis News.

#### Dairy Cows Loose in Shed.

Prof. Fraser, of the Illinois station, says in Circular No. 93: The plan of allowing dairy cows to run loose in a thed looked so reasonable, and those dairymen who had tried it reported so favorable concerning the results obtained, that it was decided to put the method into actual operation. Accordingly a shed 30x68 feet adjacent to the dairy barn was arranged for the purpose; mangers were built on each side, and the two bull pens were retained at the corners. This shed is a one-story building with windows and doors on both sides, thus affording excellent ventilation. Twenty-two cows have been cared for in this manner with most satisfactory results. From have to carry too much weight; their the experience at the university the past two years it has been found that ows keep much cleaner than when

### LAZINESS A DISEASE. Many Cases Result of Morbid Physical

#### Conditions.

Certainly not all lazy persons suffer from disease of the brain, but, ac cording to an editorial writer Americand Medicine, lassitude in children is often a cerebral symptom and should not be overlooked Says this writer: "Change of disposition in children is often wrongly interpreted, and both parents and teachers have recourse to various means to secure improvement, such as reprimanding, forcing, depriving of food, etc., although conditions grow worse instead of improving. A child

for example, enjoying heretofore good health, all at once undergoes a radical change; he becomes slow in his actions, takes more time than usual in eating, dressing, studying; his in-tellectual faculties become less vivid, memory fails, he lacks attention. The Such shocks will not turn rain and | condition is diagnosed as 'laziness' and bodily punishment is inflicted. A child like this is certainly ill, and coercive training will not improve the condition, but strictly medical attention. The subect is certainly important from a practical standpoint, as the future of such a patient depends upon the early recognition of the pathological condition. It should be borne in mind by every parent or teacher. Cheerfulness, laughter, vividness, are all attributes of youth, and if these characteristic features of childhood are rapidly replaced lassitude and impairment of intelligence, the condition is undoubtedly

difficulty in providing cows with an abundance of fresh air, they are more vigorous and healthy and have better appetites than when kept in the stable. Since they can move about and get exercise they will not suffer in cold weather if the temperature is somewhat lower than in the ordinary stable. Labor is saved, as the shed can be bedded much more easily and quickly than can stalls; there is little stable cleaning to be done and the manure is hauled directly from the shed to the field at any time most convenient and when least damage is done the land by tramping. Another advantage is the saving of fertility much more completely. Many barns do not have cement floors and so there is more or less waste of the liquid portion of the manure. Since land is becoming so high priced no farmer can afford to allow any fertility to be wasted, and by this method all the liquid is saved, as it is absorbed by the bedding. If only brough bedding is used to keep the cows clean they tramp the manure so thoroughly that it does not heat to make the air impure. If manure is hauled directly from the stable to the field there is a considerable portion of the year when it must be allowed to accumulate in the yard where it will leach hadly, or it must ic hauled onto the land when it is so wet and soft that much injury is done by tramping; this is especially true
