A COLONIAL HUSTLER.

Colonel Samuel Sloper Was a Jack of All Trades.

It is necessary that the pioneer be a man of infinite resource, who can do for himself or his neighbors every necessary task. Such a man was Colonel Samuel Sloper, one of the early settlers of Blandford, Mass., waose astonishing versatility is recorded by S. Wood in "Taverns and Turnpikes of Blandford."

Colonel Sloper, among other things. kept something of a stable and pastured horses and stock. For the munificent reward of 3 shillings the old veteran in 1788 moved the family of David Knox by means of "teame and Now and then he turned his boy." hand to odd jobs. He carted and laid out John Waldo Wood's flax one season for £7 10s.

He seems to have made shoes and garments for his family and for his neighbors. For Enos Loomis' young son, who was bound out to him, he did on this wise: "Caping your son s shoes, 1-3." "One bottle-green cont trimmed and made for Moses, 7 shill . He made several shirts and lings." a frock for the Martin Leonard company.

The number of things which this veteran and "dabster" did make an astonishing list. He was surgeon in ordinary to the parish of Blandford and this long before he had accumulated an army experience. Veterinary, too. he was. His journals are peppered over with charges for the treatment of young horses. In the account of Ellphalet Thompson in the year 1772. along with a "frying Pann" and "I Pr Sizers," is the charge, "To Seting your boys rist, twelve shillings James Sinnett in 1785 became indebt ed to "Setting your knee and Dress ings" and to "Sundri Dressings," 4 and 3 shillings respectively.

NEVER OPENING FLOWERS.

A Large Number of Plants Bear Cleis togamous Blossoms.

The never opening flower, or, as bot anists call it, cleistogamy, is well illustrated by the case of the common sweet violet. The familiar purple. sweet scented blossom, which to most people is the violet flower, hardly ever produces any seed. But altogether unseen by most people it produces a number of minute, scentless and coloriess flowers which never open.

These are self fertilized and produce abundant seed. The word cleistog amous expresses the fact that the fertilization takes place without the opening of the flower and hence without the agency of insects. Such never opening flowers occur in a large number of plants, sometimes along with blossoms of the ordinary sort and sometimes without them. It is a disputed point, however, whether there is any plant which in all circumstances will produce nothing but cleistogamous towers.

There are nevertheless a number which normally produce nothing else, As regards fertility, the seeds produced by the cleistogamous flowers are never inferior to those of the ordinary blossoms. In some cases they are superior and in others they are the only seed produced by the plant.

It has been found that the amount of eleistogamy varies with the height of the plants. The shortest bear cleistogamic flowers only, and those a litthe taller have a few small open flowers in addition to the closed ones. The tallest plants have larger open flowers, with only a few cleistogamic .-Botanical Gazette.

AN ODD EXPERIMENT.

It Explains How Cyclones Drive Straws Through Tree Trunks.

If a needle is shoved into a cork un til just the tip end shows on the opposite side and the needle is then broken off so that the upper end is flush with or hidden under the top surface on the cork an interesting thing may be shown, known as the increase of pressures. If this cork be now placed needle point down on a copper cent or other small coin a light blow on top of the cork with a hummer will drive the needle through the copper. The explanation is as follows: Everything has its limits of resist-

ance, and we may define this in terms to the square inch that will overcome it. Take a ten pound weight and place it on a surface of two square inches the pressure is evidently five pounds. to the square inch. Now take away one of the square inches, and there is just as evidently a pressure of ten pounds to the square inch. Decrease this surface to the dimensions of a needle point and put a five pound blow on the needle head. The pressure to the square inch at the point is tremendous So, of course, it can be forced through almost anything, provided the needle is kept from breaking. For this purpose the cork is supplied, which keeps the needle from starting to bend, having for this purpose what might be called an infinitely inclined plane or straight line.

This phenomenon explains several things of frequent occurrence. Cyclones sometimes drive straws through trees three and four feet thick. The compressed air round the straw keeps it from bending, and the enormous force driving it forces it through.

Of course in the case of the needle and, in fact, any pointed instrument gradually getting larger from the point the advantage of the inclined plane is made use of in continuing the motion. As it takes much less force to roll a barrel up an inclined plank into a door than to lift it directly from the ground to the door, so we can separate two things or two parts of the same thing easier with a pointed instrument (which is the same thing as a round wedges than with an instrument of the same size all the way .- St. Louis Republic.

INSECT RESISTANCE.

No Such Thing as Any Animal Having More Than One Life.

All animals have the power to recover from injury occasioned by shock -from being stunned. Insects are in no sense an exception to this, and most of them possess what has been called tenacity of fife to a remarkable degree. A butterfly will sall away with a pin through its body, an ant will go floundering around after being cut in two, and all insects will quickly recover from a blow, even if such may dent or break their external coverings In such cases the inside parts are mostly out of use for a short time. somewhat similar to the case of your arm when you have struck the "funny bone" or to your foot when it is "asleep." But after a few moments rest the wasp can again resume its actions.

A wasp is well armored. Its exterior covering is hard and almost unvield. ing. When it is struck a severe blow the soft, delicate inner parts yield to the impact; the nerves and muscular tissues cannot operate in unison, and the insect may be said to have been rendered unconscious as well as incapable, for the "mind" actions depend upon its entire nervous system.

But there is no mal's ha

Gold In Ancient Rome.

William Jacob in his "History of the Precious Metals" estimates from the accounts given by the Roman writers that in the reign of Augustus, the first of the emperors, when Rome was at the height of its power, the amount of gold in the Roman empire was nearly \$2,000,000,000. This vast treasure had been gathered chiefly by conquest from various nations of Europe, Asia and Africa There had been extensive mines in Spain and in the Atlas mountains of north Africa, but their yield in the wealth of kings and of cities in Asia and Egypt had been despoiled and carried away to enrich the conquerors.

Our First Money.

The first United States money was made in 1786, but instead of bearing the faces of leading statesmen it bore only the face of Liberty. Some few coins were stamped with the face of Washington and are highly valued by collectors. The first coins struck by the United States mint were some half dimes in 1792. The first United States dimes were struck in France from old silver family plate furnished by Washington and were known as "Martha We shington dimes" from the fact that the Liberty head was adapted to that the president's wife .- New York American.
