His condition is reported as fair.

The machine which struck Mr. Weaver is said to have been driven by F. H. Fisher, of State College, Pa.

A wise man is like a pin; his head keeps him from going too far.

STATE POLICE CAPTURE THREE FOLLOWING THIEFS

John C. Allen, of Ehrenfeld and Paul Mack and J. C. McDermott, of Seaward, were taken into custody by two members of the state police detail stationed at Indiana, as they were about to enter a mine at Indiana for work on Friday night. They were taken on a charge of an alleged theft of copper wire and equipment.

THE ACTION OF THE OCEAN

By John Connelly.

The waters of the ocean are never tranquil. Their surface is subject to the action of the winds and is therefore in constant motion. The tidal wave affects the lowest depths, while permanent currents traverse almost every sea.

Action of Waves.

Everyone who has stood on the seashore and watched the breakers roll in and dash themselves to spray against the cliffs, must have felt that the wearing action of water on the coast is considerable. On shores which are bounded by chalk cliffs, the sea margin is rendered milky by particles of the chalk which the waves have separated from the rock. This destroying action of the waves is visible on every coast. Where the sea barrier is a hard and resisting rock, frequently cliffs stand out of the water some distance from the shore, indicating the place to which the mainland formerly stretched. Examples of this are of frequent occurrence in the Scottish coast and the west coast of England. If the seaboard be of a soft species of deposit, the action is of course, much more rapid. Thus on the coast of Yorkshire, from Bridlington to Spurn, some 35 miles, the waves erode eight feet annually, so that the sea has encroached two miles since the time of the Romans. Many old maps of Yorkshire indicate that villages stood where now the waves hold undisputed possession, and ports mentioned in bygone history are no longer to be found.

All coast lines are thus acted upon, the destructive operations being carried on with more or less activity, according as the coast is low, the cliffs of soft material or of hard rock. We are not considering the gains of the sea or we might allude to many terrible inundations which the histories of Holland and the adjacent low-lying countries record, of vast tracts of land suddenly swept over by the sea, destroying hundreds of villages and their inhabitants. It is true the persevering industry of the Dutch has raised dykes against their great enemy and by enclosing many of the meers with such walls and then pumping out the water they have reclaimed from the de-

vastation much of his prey. We only mention the action of the waves as they erode the shores they wash. The particles of matter they thus mix with their waters are thus swept away by currents, and in tranquil spots, or along the path of the current, the sediment reaches the bottom and there forms a new deposit.

Of the various oceanic currents we shall first speak of the tides. All bodies attract each other. The power of the force exerted depends upon the weight of the bodies and their distance from each other. The weight of any body is, in fact, the force with which the earth attracts the body to itself. The celestial bodies are all chained together by this force of attraction. The sun and the moon both exert their attraction influence on the earth, inducing our planet to approach them. This attraction being counterbalanced by centrifugal force, we describe a curve, which is the resultant of these two forces. But the surface of the earth is made up of fluid and solid matter. The former, owing to its mobility, exhibits a greater tendency to obey the attractive force, and therefore rises to meet the sun or moon.

The great tidal waves take their rise in the deep Antarctic ocean. In mid-ocean the water under the tidal influence moves slowly, but when the wave from a deep sea acts on the water of a shallow sea, or an estuary, then the tides are high. Local causes have great effect on the tides, so that at two sea-ports not many miles apart a difference of many feet is found in the high water mark.

The rapidity of the flow is sometimes very great. It is said that in the Solway Firth the rising tide can overtake a man on horseback. As these tidal waves beat against the shores of every continent and island in the world, except those which bound inland seas, twice each day, the wearing action on the shores must be immense. The ebb tide carries out the eroded matter which is either deposited in the deep sea or swept away by the currents to subside at a distance.

The system of ocean currents may be thus described: The trade winds, as is known, are caused by the heated air rising in the equatorial regions, and the cold and more dense air flowing in from the poles to take its place. As this sweeps the surface of the Antarctic ocean it sets the water in motion in the direction of the wind, producing what is called a drift current. When once a large body of fluid is set in motion its exhibits little disposition to return to its tranquil state, and if it be acted upon by encouraging causes, a permanent current is produced. For example, take the current striking against the angle of South America. One stream follows the coast of Brazil, the

other sweeps around the Gulf of Mexico, passes south of Florida, follows the coast-line of the United States, crosses the Atlantic at 40 degrees north latitude and pours its warm waters on the coasts of the British Isles and Norway.

Besides these main systems of cur-

rents there are several smaller and less important branches. But enough has been said to show that the waters of the ocean are in continual circulation, carrying the material eroded on one coast to distant areas of deposition. The average depth of all the oceans is from 2,000 to 3,000 fathoms.

Specially Designed for Sunshine Land

THE IROQUOIS—DESIGN NO. 319

HOWLING winds and bitter cold weather are not pleasant conditions for anyone living in this little cottage, which was never intended to be built in any section where they are encountered. It has no basement and no heating system, being designed for the South or Southwest where summer temperature rules almost the year 'round. But of course it could be built to provide both and then would be altogether satisfactory anywhere. Built according to the plan, however, its only use in Northern climates would be as a summer cottage, and one wouldn't want it too far North at that, considering some summer temperatures. Built of common brick, Economy wall construction, its cost would be surprisingly low; as low as frame in fact.

is a guarantee of constant cheerfulness. The broad front porch is a feature certain to be much appreciated. From it one enters the living room, almost square, with ample wall space for pictures. To the left is the sleeping room, which connects with the bath in the rear, a feature seldom encountered in so small a home. There is no dining room save the breakfast nook off the kitchen, but this is large enough for constant use by a family of two. Directly back of the nook is a pantry large enough to accommodate the refrigerator. The kitchen is unusually large and well equipped. There is no rear porch but the extended eaves offer an opportunity for such addition with small outlay.

Something of the possibilities of exterior decoration by the judicious use of plants and vines is suggested in this illustration. The cottage of this type really demands some landscaping effects. This can be accomplished with the least outlay by planting hardy perennials, of which there is a wide variety, and by placing to advantage a limited amount of shrubbery.

The Common Brick Manufacturers' Association, Cleveland, Ohio, can furnish complete drawings for this design. Let it in brick construction sent upon request.

Bottled Sunshine

from the land of the mid-night sun. Every drop of PURETEST COD LIVER OIL Comes from Lofoten, Norway. Tested for vitamin potency.

FAMILY SIZE—FULL PINT \$1.00

Cod Liver Oil is the most potent of all strength building medicines because it contains many times more vitamins than any other substance in addition to its high nutritive value. Sold only at
