

735 NAMES NOW LISTED ON PATTON HONOR ROLL

With the induction of the January selectees, and a number of enlistments in the past month, the total number of Patton and Vicinity men and women now serving in or honorably discharged from the armed forces of the Nation, numbers Seven Hundred and Thirty-Five. Some of these boys have already paid the supreme sacrifice; others will, maybe many of them. The way you can help is to do everything you can, always, toward the furthering of the war effort—buy bonds and stamps. And prayer, too, surely helps protect your loved ones.

Many Mountain Streams Aid Chile's Electrification

Chile's announcement of a national electrification project to be completed in 18 years draws attention to the country's favorable topographic situation with regard to water power development. Many rivers are born on the lofty slopes of the Andes highlands, flow swiftly westward across the country to Pacific outlets, form a many-runged water ladder with its top near the Peruvian border and its bottom close to the Straits of Magellan. Power from these rivers would assure progressive industrial development, conserve the domestic coal reserves, and activate the country's dormant resources. Water, apart from its conversion into kilowatts, has greatly influenced Chilean life. The sea modifies the extremes of climate, changes the course of ships by the strong "set" of the mighty Humboldt Current, shapes plans and fortunes by its winds and tides and fogs, is the source of a sizable fishing and whaling industry, and provides routes for the shipment of strategic materials. It gives Chile access to foreign sources for needed machinery, textiles and oil, and sustains valuable coastwise trade.

Oil Discoveries Drop

Behind growing concern over possible exhaustion of oil reserves is the steady decrease in the rate of new oil discoveries since 1936. Last year, and in each of five years preceding, the United States produced roughly 1,400 million barrels (42 gallons each) of a total world production of about 2,100 million barrels. So far, revised estimates of reserves in known fields plus new oil discoveries have each year exceeded the national production, and have raised known reserves to a 1943 level of 20,000 million barrels. New discoveries alone, however, have dropped from a 2,000-million-barrel annual total of a decade ago to 800 million barrels in 1938, and to 260 million barrels in 1942—less than the annual civilian consumption at the current limited rate. Size of the average new discovery dropped from 20 million barrels in 1934, to 11 million barrels in 1938, and to 1.2 in 1942.

what ONE ACRE can do

America's food and feed production goals for 1944 exceed all records. The question is being asked—"How many more acres must be put under the plow?" In the face of labor and machinery shortages, the question might better be—"How much more can be produced on every acre now being farmed?" Experiment station results show that the intelligent use of potash, properly balanced with other essential plant foods, can greatly increase yield and quality. If you do not know just how much potash your soil needs to make every acre do its best, your official agricultural advisers will tell you.

TAKES MORE THAN A DUCKING TO STOP A JEEP

JACK-OF-ALL-TRADES in America's global war, the jeep is in its element in the jungle or when bucking through the surf. Here one takes a briny plunge as it climbs onto a landing strip during the successful invasion at Arawe, New Britain, which extended the Allied grip in the Pacific. Incidentally, so impressed are our troops by the dependable vehicle, many have placed it on their lists of post-war purchases. (International)

CLOSE-UP OF NAZI 'SECRET WEAPON'

THIS BEING A WAR of "secret weapons," here is the German contribution, which is no longer a secret. It is a rear view of the much written about rocket guns used on the Russian front. Weapons of this type, on a much larger scale, are believed to line the French Channel coast for use against the Allies when they start their invasion. (International)
