Marketing Early Potators.

To those who are unfamiliar with potato growing, the high prices which early potatoes command might seem to make it an object to dig a large part of the crop and market it while the price is up. But there are several drawbacks in marketing potatoes early. The weather is hot, and while the skins of potatoes are tender, they will rub off their jackets if handled freely, and the potatoes are tender, they will rub off their jackets if handled freely, and the potatoes are tender, they will rub off their jackets if handled freely, and the potatoes are tender, as only a few of the largest are of marketable size, and those that will sell would grow still larger if left a few days longer in the hill.

How Much He'd Be Missed.

How Much fie'd Be Missed. "Henrietta," said Mr. Meekin, "do ou think you'll miss me?"
She looked at him in surprise and

"When?"
"Mr. Meekton," she answered, "I ave had reason for resenting a great many things, but I am willing to own that if Spanish marksmanship is such that you are missed in the war as often is I will miss you at home there won't be [ ] risks for you whatever."

Goldfish are of Chinese origin. They were originally found in a large lake near Mount Tsientsing, and were brought to Europe in the seventeenth century. The first if France came as a present to Mme. De Pompadour.

### THE EXCELLENCE OF SYRUP OF FIGS

I'ME EXCELLENCE OF SYRUP OF FIGS is due not only to the originality and simplicity of the combination, but also to the care and skill with which it is manufactured by scientific processes known to the California Figure 7.

Co. only, and we wish to impress upon all the importance of purchasing the true and original remedy. As the genuine Syrup of Figs is manufactured by the California Fig Symup Co. only, a knowledge of that fact will assist one in avoiding the worthless imitations manufactured by other parties. The high standing of the California Fig Syrup Co. with the medical profession, and the satisfaction which the genuine Syrup of Figs has given to millions of families, makes the name of the Company a guaranty of the excellence of its remedy. It is far in advance of all other laxatives, as it acts on the kidneys, liver and bowels without irritating or weakening them, and it does not gripe nor nauseate. In order to get its beneficial effects, please remember the name of the Company—

CALIFORNIA FIG SYPUP CO.

SAN FRANCISCO, Cal-LOUISVILLE, Ky. NEW YORK, N. Y.

Feeding Millet.

Millet, both hay and grain, is a fatming food, and when fed to either
press or cows wheat bran or mid-Millet, both hay and grain, is a fattening food, and when fed to either horses or cows wheat bran or middlings should form a part of the ration. This is especially necessary with cows; otherwise the millet will serve to fatten rather than to increase the flow of milk. If only the hay is fed the ration should be only about half feed and the meal made up with clover hay. In feeding the millet hay to horses the objection that it has a bad effect on the kidneys may be removed by cutting up the hay, wetting it with warm water and mixing two quarts of wheat middlings and a tablespoonful of linseed meal with the hay. This makes a nutritious feed and one that will leave no bad effect on the horses. The same mixture may be fed to cows with advantage.

A Permanent Strawberry Bed.

the same mixture may be fed to cows with advantage.

A Permanent Strawberry Bed.
On many farms the strawberry bed has been allowed to run wild and form a complete sod. As a rule, it is best to plow under such a bed and make a new one, but sometimes this is the only available spot for the purpose and with proper management no crop of berries need be lost. At any time after the bearing season is over and before the ground freezes in the fall, secure a good one-horse breakplow that will turn a narrow furrow, eight inches being sufficient. Have the cutter well sharpened and then set stakes where you want your rows of strawberries, and plow the ground between the rows, throwing the earth away from the rows. Be careful to keep your furrows straight and plow to within about three inches of the stakes. Now begin on the opposite side and do the same and a block of strawberry plants six inches wide will be left standing for each row.

Rest For Milking Cows.

It is, we think, a fault of some of the best breeds of milkers that they cannot be easily dried off, even when they approach the time for dropping their calf. An interval of at least a month, and six weeks is still better, should he left to the cow, in which she forly of pod for food for varying periods before parturition. denending much.

Rest For Milking Cows.

It is, we think, a fault of some of the best breeds of milkers that they cannot be easily dried off, even when they approach the time for dropping their calf. An interval of at least a month, and six weeks is still better, should be left to the cow, in which she should have an entire rest. Milk is not good for food for varying periods before parturition, depending much on the age and condition of the cow and the kind of food she receives and digests. A cow thin in flesh may require eight or even ten weeks' rest before beginning milking again. While we believe that young heifers after their first calf should be kept in milk until within a month or six weeks before the mext calf is due, it is rather to get them into the habit of long milking than because the small amount they give will be worth the extra feed and labor required to secure it.

amount they give will be worth the extra feed and labor required to secure it.

Unless to supply milk for household use in winter there is little advantage in milking the cows that calved in the spring longer than January of the following year. From eight to twelve weeks with comparatively little grain feed will leave the cow in better condition for next year than will crowding her stomach with grain, so as to force milk production until near the time her next calf is due to be dropped. This last will possibly increase the milk flow when the cowsprings her bag for the coming calf, and thus cause garget, which is an evil that the best milkers are always most likely to suffer from.

Until near the time of parturition the cow should be fed enough grain to make her gain in flesh. But for two weeks before she calvest this grain feed should be withheld, lest it stimulate the milk flow too much. After the calf is a week old, and the danger of inflammation has past, the grain feed in such quantities as to fatten the cow rather than increase her milk flow.—American Cultivator.

Protect the Toads.

the cow should be fed enough grain to make her gain in flesh. But for two weeks before she calves this grain feed should be withheld, lest it stimulate the milk flow too much. After the calf is a week old, and the danger of inflammation has past, the grain feed in findammation has past, the grain feed ing may be resumed, taking care not to give grain feed in such quantities as to fatten the cow rather than increase her milk flow.—American Cultivator.

Protect the Toads.

That the toad is beneficial to the farmer and particularly to the gardener is admitted by everyone who has observed its habits. Additional facts have been secured by recent observations at the Massachusetts Experiment Station which show elvern per cent. of the toad's food is composed of insects and other animals directly injurious to cultivated crops or in other ways obnoxious to man. The toad feeds on worms, snails, sow bugs, common greenhouse pests, and the many legged worms which damage greenhouse and garden plots. It feeds to some extent on grasshoppers and crickets and destroys large numbers of ants. It consumes a considerable number of May beetles, rose chafers, click beetles or adults of the wire worm and potato beetles.

To all agriculturists the toad renders and gracenplouse ewners may make this animal of especial value. Every gardener should aim to keep a colony of toads among his growing crops and the practice of collecting and transferring them to the gardens is a commendable one. While the sense of locality is strong in the toad and the wire worm and potato beetles.

To all agriculturists the toad renders and gracenplots. If feeds to some extent on grasshoppers and crickets and destroys large numbers of ants. It consumes a considerable number of May beetles, rose chafers, click beetles or adults of the wire worm and potato beetles.

with artificial shelters made by dig-ging shallow holes in the ground and partially covering them with a bit of board or flat stone. In such places toads will often remain for many days, sallying forth at night to seek food.

days, sallying forth at night to seek food.

The enemies of the toad are hawks, owls, and, worst of all, small boys, who stone and kill many of them. Dr. C. F. Hodge states that he found 200 dead or wounded toads in a single day on the shores of a small pond on the grounds of Clark University. The loud cry of the toad at spawning time readily betrays its presence, and small boys, and sometimes those of a larger growth, gravitate toward the pools as naturally as do the toads themselves. There have been excellent laws enacted to protect insectivorous birds. Why should there not be as stringent legislation against the destruction of toads?—American Agriculturist.

of animals.

On high priced land summer feeding of grain, especially to milch cows, is often good economy, The acreage of grass required is much reduced. The extra food will show in butter, too.

butter, too.

There is no disinfectant and deodorizer as good as sunlight and air. Keep the barns and stables as light as possible, and the stock will be much more comfortable and healthy than if kept in semi-darkness.

In semi-darkness.

It is useless to attempt to keep well animals in a healthy condition where they are compelled to eat and sleep with the sick ones. Quarantine regulations are absolutely necessary for the successful handling of herds when disease once finds lodgment among them.

A PLOT FOR A NOVEL

One Offered Ready-Made for the Desperate Literator.

A novelist in Boston—do not laugh, there are novelists in Boston, yes, and actually living here—said to us the other day, "if I could only find a plot!" Here is a plot for him free of charge, and the story is a true one:

In 1739 a lady—a real lady—came into Birmingham, England, with a handsome equipage, and desired the landlord of the inn to get her a husband, being determined to marry some-body or other before she left the town. The man bowed, and supposed her ladyship to be in a facetious humor, but being made sensible how much she was in earnest, he went out in search of a man that would marry a fine lady without asking questions. After many repulses from poor fellows who were not desperate enough for such a venture, he met with an excise man, who said he "could not be in a worse condition than he was," and accordingly went with the innkeeper and made a tender of himself, which was all he had to bestow on the lady, who immediately went with him to one, who gave them a license and made them man and wife, on which the bride gave her spouse £200, and without more delay left the town and the bridegroom to find out who she was or unriddle this strange adventure. Soon after she was gone two gentlemen came into the town in full pursuit of her; they had traced her so far upon the road, and, finding the inn where she had put up, they examined into all the particulars of her conduct, and on hearing she was married gave up their pursuit and turned back.

Truly a noble dame, one worthy of a full length portrait in the gallery contracts.

married gave up their pursuit and turned back.

Truly a noble dame, one worthy of a full length portrait in the gallery constructed by Thomas Hardy.

Why did this noble dame offer herself to the first comer? And why were the respectable males of the town so backward? There was no blint of scandal. Who were the pursuers? Did she wish by one sudden marriage to escape one deliberately contrived and repugnant? Was the excise man a perty fellow in spite of his abject condition? Did she ever see him again? Did she ever regret that she lad not braved the world and lived with him? Perhaps the memory of her apparition haunted him; perhaps it roused him to doughty deeds. It's a pity that Mr. Hardy has not accounted for her action and her fate with his grim irony.—Boston Journal.

A huge sundial made entirely oplants and flowers adorns the South Park, Chicago. The standard which casts the shadow is also decked with flowers, and is made to resemble a gi-gantic ear of corn.

istocrats who affect these nails cannot write, dress themselves or even feed themselves.

The Slamese hold the long finger nail in the same reverence we hold the family tree. Many of them never have their nails cut from the day of their birth. On the first finger the nail is of moderate length—three or four inches—while on the other fingers the nails grow occasionally to two feet. The thumb nail, which is also allowed to grow long, after reaching a certain length curves around like a corkscrew. In both China and Siam the owners of long nails wear metal cases over them to preserve them, made of gold or silver, and jeweled. While long nails are not regarded as singular in China, they are rarely met with except on fanatics and pedantic scholars.

Among the fakirs in Hindoodstan a peculiar custom is that of holding the hand tightly clenched and in one positions so long that at last the nails grow through the palm, emerging at the back of the hand and growing thence almost to the wrist. When the wasted muscles refuse to support the arm any longer it is bound in position with cords.

In Nubla the long nail is regarded as

longer it is bound in position with cords.

In Nubla the long nail is regarded as indicative of good breeding. The aristocrats constantly subject their fingertips to cedar wood the to insure a good growth.

The inhabitants of the Marquesas islands are among the most expert tatlosers on earth, and not even the crown of the head, the fingers and the toes are exempt from the needle. The hands are ornamented with utmost are, all the fingers having their own pattern, so the hand would look as though incased in a tight-fitting glove were it not for the finger nails of enormous length which complete the hand adornment of the weathlier natives.

Washing Milk Vessels,
All through the warm weather,
Iteular care is needed to cleanse
sels that have contained milk. If
particle of milk is left in the cre
or corners of vessels, it will sour
affect any milk that is afterward
ed. Many people in cleaning milk
vessels wash them first with seal affect any milk that is afferward addied. Many people in cleaning milk from
vessels wash them first with scalding
hot water. This is a mistake. The hot
water only coagulates the albumen,
causing it to stick more closely to the
sides of the vessel. If it be of tin, the
souring of the milk soon eats through
the coating of tin, and causes rust on
the iron beneath it. What we call tin
is merely from with a very thin tin coating. No such vessel is fit for long use,
as the tin will wear through, and all
the more quickly if the coagulated albumen, made by hot water and milk,
requires hard rubbing to remove it.
The right way to clean milk vessels is
to rinse them well with cold water,
and then scald them, to destroy any
germs that the cold water may have
left.

\$100 Reward. \$100.
