Feel the Influence. Cold and heat alike aggravate neuralgia, because the nerves feel the cold and heat sensitively, but nerves are sensitive to treatment and feel the influence of St. Jacobs Oil, which cures the aliment AGRICULTURAL.

aptly. Ex-Senator Call, of Florida, familiar figure in Washingto fter the old custom, carries al apers in his high hat.

Tomatoes in Pest and Ashes. At the recent horticultural exhibit in Hartiord, Conn., some excellent tomatoes were shown by the New Haven Experiment Station, which had been grown in a soil of coal ashes and peat. This rather unpromising mix-ture proved especially suited to green-house conditions, where plenty of heat and moisture are supplied. Tomatoes were finer thus grown than those in the same exhibit grown in ordinary soil. The object in using this mixture is to discourage the growth of the minute worms which cause root galls and weaken the tomato plants. Improving a Spring. Don't Tobacco Spit and Smoke Yoar Life Away. of sowing. Water should then be placed in the pan so that the bottom of the pockets are kept wet atall times but care should be taken not to use water enough to cause the seed to float. After the seeds are put in the several pockets, the wires are drawn together, thus closing the tops of the pockets, and the pan should be kept in a room where the temperature is from sixty to seventy degrees. Keep the seeds in the pockets for a length of time suf-ficient for all of them to germinate that will do so, for many of them, even of the same variety, will sprout sooner than others. The proper percentage to germinate differs with the varieties. Peas and beans should germinate to in the york per cent, while if fity per cent, of the seeds of celery germinate, it will be a fair showing. By this method combined, as suggested with the selection of a reliable seedman, farmers ought at all times to be rea-sonably sure of their seed.—Atlanta Journal.

The sating of Butter. The Sating of Butter. In Denmark, as soon as the butter-milk has been removed the butter is 1 weighed, in order to calculate the amount of salt required, and the salt is worked in at this time, usually on the butter worker. Sometimes it is all incorporated at one working, but in many cases it is preferred to add it in two workings, says the Dublin Far-mers' Gazette. The amount of salt weed is not uniform. It was adapted to the taste of the market where it is expected to be sold, but it varies be-tween four and five per cent. of the weight of the butter. The salt is worked into the butter worker, and the salt is expected to be sold. Not it varies be-tween four and five per cent. of the weight of the butter. The salt is worked into the butter working, and it is eithen laid side for some time before the next working takes place. In sum-mer it is put in butter coolers, which are a sort of ice box. In winter it is eithen laid in large rolls in the butter through or on a table provided for the purpose. It lies here for a couple of hours in the cold seson, but when the weather is warm it is allowed to remain for eight or ten hours, or until the cool of the following morning, be-fore it receives the final working. The object is not only to be come firmer, nut also tallow the salt to dissolve and penetrate the whole mass. When the butter has attained the proper de-gree of firmess, it is gain put through the worker, and a considerable portion of the brine formed from the salt is worked out. The amount of working it can stand differs much in individand cases. Care is taken, however, that it is not the least bit orerworked, so as to become greasy and sticky. This working may be repeated a couple of the throne working an hour two latter. The main point is not to work it until it has become (decidedly firm, and yet remove as much as possible of the brine which has formed from the dissolving salt. It is worthy of notice that athough four per ces

A \$500 RAT'S NEST.

The Government Will Now Restore it to the Discoverer.

be pleasanter English navy.

The Discoverer.
An interesting story about five United States Treasury notes that were found by John Veeley, a carpenter, more than thirty years ago in an old box car in Louisville, Ky., was revived when a bill for his relief, which has been pending in Congress for years, and which had already passed the Senate, passed the House. It thus becomes a law, and Veeley will get good American dollars to the amount of \$500, and interest, in the bill was called up by Representative Zenor, of Indiana. 1 It was first introduced in the Senate during the Fifty first Congress on April 25, 1800, and referred to the Committee on Claims. Senator Turpie securred its passage in the upper house May 17, 1877. It is in the reports of the Committee on Claims that the story of the Treasury notes is told. According to these reports John Veeley was, on September 29, 1868, employed in Louisville, Ky, as a carpenter, by the Louisville and Nashville Railroad Company, and while tearing out the end of an old box car which was under repair, he found five United States Treasury notes, payable to bearer, of \$100 each. The notes were somewhat mutilated and appeared to have formed part of a rat's nest, but there appears to have been no difficulty in determining their charcher, their denomination and date, and the issue and series to which each belonged. Veeley took the notes to the Louisville Custom House, and they were forwarded to the Treasury Department, with the approval of the Secretary, tiesy were returned to the Treasury Department, and the matter was referred to the First Controller, who decided that is alleged that an officer asset to the treasury Department, and the matter was referred to the First to secure payment from the frees were down, and what were returned in the hands of the Treasury Department, and the anter was referred to the First to secure payment from the frees were down, and what were returned in the hands of the Treasury Department, and the anter was and tenge the reduce to the First to secure the redeemed nor

Man Not Always a Flesh-Eating Anima Man Not Always a Flesh-Eating Animal. Primitive man originally subsisted on a diet consisting purely of fruits and roots; but though fructivorous by instinct and by reason of the con-formation of his digestive organs and dental system, in which respect he is nearly allied to the apes, which are all fruit-eating animals in their natural state, he soon became omnivorous from necessity, and his stomach readily adapted itself to every kind of food.

readily adapted itself to every kind of food. If the Darwinian theory be accepted and the descent of man from simian ancestors be granted, we have further argument in support of the fact that flesh-eating was the outcome of civil-ization and climatic necessity rather than of natural craving. Exposed at the epoch of the grace stension of the glaciers, which at one time covered all our momentains, to the hardships of an inclement climate, man required something more nourishing and heat supplying than the vegetable diet which sufficed for him in a higher temperature; and in the palacolithic age we find him not only destroying animal life, but provided with and utilizing the means of cooking the victims of his rough-hewn knife and spear.—Medical Record.

spear. --Medical Record. How a Gold Field Was Discovered. A novel way of discovering a gold field was recounted by the Hon. E. H. Wittencom, Agent General for West-ern Anstralia, in his lecture at a meeting of the Royal Colonial In-stitute, held at the Whitehall rooms last night, under the presidency of the Earl of Onslow. In 1888 the Mallina gold field was discovered by a lad in this wise: The boy, in picking up a stone to throw at a crow, observed a speek of gold in it, and reported it to the nearest resident magistrate. The magistrate was so excited at the news that he telegraphed to the then Gov-ernor, and stated that a lad picked up a stone to throw at a crow, in his ex-citement omitting to say, "and saw gold in it." So the Governor wired back these words, "What happened to the crow?"-London Telegraph. Again tend. Encland here a vantilet.

namer the purpose, then have a num-ber of stiff wires long enough to it over the pan crosswise. A strip of cotton flannel eight inches wide is then laid on the wires and then press down between each two, forming pockets about two inches deep. After the pockets are made of equal depth sew he cloth to the wire to prevent slipping. In testing, naturally the greater number of seeds used the more comparation of the seeds like beans, peas, squash, etc. Sow the seeds like beans, peas, squash, etc. Sow the seeds selected in the various pockets abeleted in the various potekts one variety in a pocket, marking on the outside of the pan opposite ing on the outside of the pan opposite the pocket the variety, name and date

Life on a Torpedo Boat. So injurious is life on a torpedo boat that a year's continuous service will mentally and physically incapacitate a man. This assertion is made on the authority of Lord Charles Beresford, but that the strain on any one serving on these craft is very great is shown by the fact that to one month's service the British naval regulations allow one week off. Austria is endeavoring to mitigate the hardship of service on these boats, and life on one built for the Austrian navy and tried on the Thames recently was demonstrated to be pleasanter than on those of the English navy. 40 to 60 per cent Saved Buying Here.

A WALL FOR THE SPRING. filed nor become the home of a variety of animal life.

1

field nor become the home of a variety of animal life. Let the spring be cleaned out care-fully; then let either a square or cir-cular wall of brick or stone be laid up in cement, a pipe being inserted for outlet, as shown. A closely fitting cover completes the improvement. By this plan a supply of water can be accumulated for stock by simply clos-ing the outlet until the tank becomes full. Otherwise the stock might have to wait a long time in turn for a chance to drink. A walled and cov-ered spring will also be found much cooler in hot weather than the one that exists in a natural state. Experiments With Fruit.
