There is a good deal of discussion among the golfers in London about the rubber-cored ball. The best players say the lively ball puts the inferior players in the class with them, and they are opposed to it.

TUNNEL SAFETY SIGNALS.

Are Put at Either End of the Berger

Are Put at Either End of the Bergen Boring.

The Erie Raliroad Company has recently installed a system of safety signals in the Bergen tunnel, Jersey City, which is hoped will prove a perfect safeguard against accidents. This tunnel is about 4,500 feet long, cut throught solid rock, and the darkness of the interior in intense. There are two tracks, and heretofore in case of an accident to a train in the tunnel there was no means of preventing a second train from rushing in and being wrecked in the debris of the first. The tunnel is now supplied with signal boxes located 200 feet apart, with an electric light over each. In case of accidents it in the duty of one of the trainmen to remove a plug from one of the signal boxes, which immediately causes the flashing of red lamps at either end of the tunnel, thus giving a signal to all approaching trains.

Jeff Seaton, coal operator located near Shelbina, Mo., has opened two mines—one for uninon and one for non-union men—so that the miners can take their choice. Eleven men have commenced work in the non-union mine and 15 have gone to work in the other. The same scale of pay is in effect at both mines.

FARM (11) MATTERS.

Selecting Seed Corn.

To save seed corn select the ripest, heaviest, earliest ears, and from the strongest and most prolific stalks. In this manner the corn can be improved every year, and at a very little expense and care.

Restoring Worn Out Solls.

When soils are partially abandoned because of the expense of restoring them by the purchase of fertilizers, the farmer has at his command the opportunities of green manures. The old system of farming was to recuperate the soil by allowing it to rest for a year or two, by not compelling it to produce a crop.

Stones in the Garden Soll.

Don't be impatient to get all the small stones out of your garden soil. Any as large as a baseball should certainly be taken out, but the smaller stones, especially those the size of a marble, help the soil by keeping it loose, allowing good circulation of water and helping to warm it somewhat. This is especially valuable where an early crop is wanted.

Having a Specialty.

It is not a bad plan for any farmer to have some specialty aside from his regular crops, if he is not too short for help. Among the things to be suggested a small area in some one fruit would be within reach of all. This would afford a profit in the majority of seasons, and every now and then comes a year when a fruit crop is worth a very handsome sum.

worth a very handsome sum.

Improving Poor Land.

Poor land can never be improved unless something is added to it. It is cheaper to allow time, in the effort to grow crops to be plowed under, than to attempt to take a scanty crop from the land. When the land is poor the manure should be concentrated on smaller areas, and allow a portion of the land to go uncropped until manure can be given to it. Time will be saved, however, by using green manurial crops and fertilizers. The farmer who pays taxes on poor land taxes himself unnecessarily.

nnecessarily.

Tramping Seed Into the Earth.

Peter Henderson some years ago called attention to the use of the feet in planting vegetable seed in dry weather. If small seeds are sown and loosely covered with dry earth they often fail to germinate, or, just after germination, they lie and perish. If, however, the earth is compressed about the seed at the time of planting, such drying does not occur, and the seeds germinate well, even when the ground is very dry. To be sure, if the ground is full of moisture, this method would not be followed.

not be followed.

Oiling Harness.

It is a good plan to keep harness well oiled, as it will make it wear longer and keep it soft and pliable and much more easily handled. Soft, well-oiled harness will stand more pulling than a set that has not been oiled. It takes the life and toughness out of leather to use it without oiling. The cost of the oil and the work of applying it will be saved many times by the harness lasting longer and the saving in repairs. The harness can be oiled some wet day when little else could be done, and the time consumed in doing it will hardly be missed.—The Epitomist.

Epitomist.

Temperature For Bees.

Bees should be kept at a temperature ranging from forty-two to forty-five degrees above zero, and the hives should be dry. The light should be excluded as much as possible and the hives should not be exposed to sudden changes of temperature. An ample supply of honey should be left for the support of the bees during the winter. It is not necessary to put the hives under shelter until winter approaches and if the colony in each hive is not strong it will be of but little service until it recovers in the spring. Too much warmth in winter is not conducive to success.

ducive to success.

Salt in the Manure Heap.

Salt in the manure heap will prove beneficial. As kainit contains a large proportion of salt, and also a percentage of crude sulphate of potash, it may be mixed with the manure by turning the heap over, care being taken that all portions of the manure be sprinkled with the kainit. It prevents loss of aumonia to a certain extent and adds potash to the manure, while salt at tracts moisture and serves as an aid to prevent "fire-faminig" of the manure. Whenever manure is turned over the coarse materials should be placed in the centre in order that they may more quickly be decomposed.

more quickly be decomposed.

The Hay Press.

The farmer who has more hay than barn room will find it a good investment to have a hay press that he may put it into smaller bulk, so that there will be room for it in the barn, instead of stacking it out of doors. It will keep better, and if he has any to sell it will be more easily handled and sell more readily at a better price. If one cannot afford to buy a press, let those in a neighborhood who are likely to want to use it unite in owning. The hay may be stacked until the cutting and curing is over with, if one does not wish to run the press in haying time, but the quicker the stack is reduced to bales the better.

farm pays. This is due to the fact that fertility in the soil is cumulative, the results of the first year being but little, apparently, though every year thereafter the farm will increase in productive capacity. The system of farming practiced will also influence the future of the farm. Where stock is a specialty the results are nearly always excellent, and rotation of crops aid in giving a profit, but the largest gain is when the farmer uses fertilizers liberally and gives his attention to the preservation of the manure produced on the farm.

Lapped boards form the roof. One end of each rafter rests upon the ground, while two posts support the other ends. The ends of the shed are boarded up, the whole taking not more than half an hour's work, while the whole can quickly be taken apart at the end of the season.—New York Tribune Farmer.

Intensive Farming.

Intensive cultivation lays up for the future just as much as the improvement of a piece of property in a good neighborhood increases the valuation of the land for the future. One might make annual outlays for improving property, and not get actual returns for two or three years. So in the system of intensive cultivation the returns may be several years ahead. In the matter of the soil one finds that the land improves through intensive cultivation slowly but surely, and while we may not be able to see the improvement this year or next it will in time come. Some soils are in such poor condition that it requires at least two or three seasons to make them respond to intensive systems of culture. Likewise some crops do not respond quickly to the careful selection of seed and thorough cultivation.—Michigan Farmer.

and thorough cultivation.—Michigan Farmer.

Uses of Fallen Leaves.

Forest leaves make an excellent bedding for stables, and at the same time one of the richest fertilizers. It is not good policy, however, to gather the leaves from a piece of woodland, as such action will in time exhaust the soil and cause injury to the trees. When the leaves blow into ravines they may be gathered and used at the barn. Dry leaves, held in place by a few boughs, make an excellent protection for such vegetables as lettuce, spinach, onlons, etc., as are wintered in the open air. Leaves forked in about young trees keep the soil loose and promote rapid growth. Leaves thrown into the scratching pen where chickens are confined in winter are excellent to give them exercise in hunting for their food. They also are excellent for closing the crevices in old pens where chickens, pigs, etc., may be confined in winter. When leaves are yearly removed from a lawn it is necessary to return to the soil a fertilizer equivalent in value to the leaves removed.—Dr. George G. Groff, in New York Tribune Farmer.

Does Farming Pay?

Farmer.

Does Farming Pay?

The question as to whether farming pays is not fundamental. It is merely incidental. A necessary occupation must pay. Too often it is answered in the negative by the mere citing of cases in which farming is unremunerative. The abandoned farms of New England may not pay, else they might not have been abandoned. Yet even bere there may be a fallacy. Perhaps the farm that has ceased to be profitable under the old system of farming may be made to pay under a new system. Strictly speaking there are probably no abandoned farms in New England. There may be a change in ownership and in methods, but the lands still yield a crop for somebody. They have not reverted to the public domain. The management of land is undergoing a radical change. This change may result in hardships to the individual who will not accept the new order, but it works to the betterment of the farm and consequently of the community. Farming pays even though a farmer here and there may fail.—F. H. Sweet, in The Epitomist.

Old and New Strawberry Beds.

Very rarely have we had a season more conducive to the growth of weeds in the strawberry beds than this has been. We could not get into the garden to root out the weeds for weeks at a time, and the consequence was that the plants were almost swamped. Heroic treatment was required to clear them out. But we have done it. First we went over the plot with a scythe, cuiting down all the grass, ragweed and other foul sund. This was raked off and drawn away on the stone boat. The farmer who has more hay than barn room will find it a good invests ment to have a hay press that he may put it into smaller bulk, so that there will be room for it in the barn, instead of stacking it out of doors. It will keep better, and if he has any to sell it will be more easily handled and sell more readily at a better price. If one cannot afford to buy a press, let those in a neighborhood who are likely to want to use it unite in owning. The hay may be stacked until the cutting and curing is over with, if one does not wish to run the press in haying time, but the quicker the stack is reduced to bales the better.

Increasing Fertility of the Farm.

The profit from farming comes in slowly, and several years may clapse before the farmer is aware that his Vork Tribune Farmer.

PE-RU-NA CURES CATARRH OF KIDNEYS EVERY TIME.

1

Life out of doors and out of the games which they play and the enjoyment which they receive and the efforts which they make, comes the greater part of that healthful development which is so essential to their happiness when grown. When a laxative is needed the remedy which is given to them to cleanse and sweeten and strengthen the internal organs on which it acts, should be such as physicians would sanction, because its component parts are known to be wholesome and the remedy itself free from every objectionable quality. The one remedy which physicians and parents, well-informed, approve and recommend and which the little ones enjoy, because of its pleasant flavor, its gentle action and its beneficial effects, is—Syrup of Figs and for the same reason it is the only laxative which should be used by fathers and mothers.

Syrup of Figs is the only remedy which acts gently, pleasantly and naturally without griping, irritating, or nauseating and which cleanses the system effectually, without producing that constipated habit which results from the use of the old-time cathartics and modern imitations, and against which the children should be so carefully guarded. If you would have them grow to manhood and womanhood, strong, healthy and happy, do not give them medicines, when medicines are not needed, and when nature needs assistance in the way of a laxative, give them only the simple, pleasant and gentle—Syrup of Figs.

Its quality is due not only to the excellence of the combination of the laxative principles of plants with pleasant aromatic syrups and juices, but also to our original method of manufacture and as you value the health of the little ones, do not accept any of the substitutes which unscrupulous dealers sometimes offer to increase their profits. The genuine article may be bought anywhere of all reliable druggists at fifty cents per bottle. Please to remember, the full name of the Company—CALIFORNIA FIG SYRUP CO.— is printed on the front of every package. In order to get its always necessary to buy the ge
