IDNEY COLDS. Nothing will "lay you up," "play you ut," "put you to bed" qulcker than kidney cold. Thousands feel the rst effect of cold in the kidneys.

Doan's Kidney Fills crue all kidney ills from common back-ache to dangerous diabetes.

A. T. Rittenour, owner of the wood yard at 125 East Cork street, Winchester, Va., says: "Ever since I had la grippe I have been a sufferer from kidney troubles, which made themselves apparent in racking pains through the region of the kidneys and across the small of my back. The pains were always severe, and sometimes so sharp and biting that they compelled me to the complete of the compl

rom colds."

A FREE THAL of this great kidney needleine which cured Mr. Ritenour will be mailed to any part of the United states on application. Address Foster-filburn Co., Buffalo, N. Y. For sale y all druggists. Price, 50 cents per

Through German Eyes It Be-

Seen Through German Eyes it Becomes Something Wonderful.

A Berlin paper of recent date, in an article on the "cake walk," the "new American dance, which threatens to become popular in Europe," gives this startling account of the origin of the dance. "At a dinner given by a weathy plantation owner a rich negro and his wife were guests. The black pair were so inflated with pride at being there and walked with so much studied "air" that they attracted much attention. When the black couple had retired the host offered a prize of a cake to the man and woman giving the best imitation of the black pair's walk. Everybody wanted to win the prize, men and women did their best to produce the pose and step of the figh-nosed negroes, and that was the first cake walk." The careless German historian falls to give the name of the planter who entertains his black neighbors and makes fun of them after they have gone. Evidently the writer is angry with the United States for searding the cake walk to Europe, for he says: "Last year there was exhibited at the South Kensington museum the art treasures which J. Pierpont Morgan bought of Mannheim, the collector. There were 13 cases full of these magnificent pieces of silver enamed and falence. At the same time one could see at the Guild hall other works of art for the Morgan palace, while at Cherbourg, and at Havre priceless pictures were being transported to America. And for these treasures what does America bring us? Thescake walk."

All Bobbing Up.

At the time of the recent Yale-Harward football game in New Haven the hearly thirty thousand people present so filled the streets of the Elm City that there were crowds everywhere. The little daughter of Rev. Mr. Mudle had come to town with her mother. When she saw these great throngs of people all around her she showed her early religious training by exclaming: "What is it, mamma—resurrection dagg"

Mexican Carts.

A large proportion of the transportation of Mexico is done in two-wheeled carts, with wheels six feet in diameter. This is due to two reasons, one being that wagons are taxed according to the number of wheels, and also because the carts can get about narrow streets, which are so numerous in Mexican cities.

Tired Out

Tired when you go to bed, tired when you get up, tired all the time. Why? Your blood is impure, that's the reason. You are living on the border line of nerve exhaustion. Take Ayer's Sarsaparilla and be quickly cured. All druggists.

ur doctor what he thinks of Ayer's illa. He knows all about this grand ly medicine. Follow his advice and esatisfied. J. C. AYER Co., Lowell, Mass.

SCIENCE IN THE DAIRY.

PRECAUTIONS THAT VERY NEAR-

college Graduates and Professors
Among the Managers—Care of the
Cows—Measures To Keep Germs
Out of Milk—Success of Enterprise

A present achievement of scientific farming is the production of milk so free from germs that bottled as it is taken from the cow and scaled it has been transported across the ocean and brought back still in perfect condi-

free from germs that bottled as it is taken from the cow and sealed it has been transported across the ocean and brought back still in perfect condition.

The farms where this milk is produced are not conducted on agricultural experiment station lines, the first object being to produce milk practically free from bacteria; profit being a secondary consideration, although it is by no means ignored.

The undertaking is unusual in unitigunder the control of a single corporatio eighteen farms situated near as many large cities, the aggregate area being 7460 acres, and the number of cows milked daily averages something more than 3000. The conduct of these different farms is identical.

Each has a resident manager in charge. Most of these managers are college gradustes and a number have been professors. It is required that all managers, whatever their previous training, shall spend some time in one of the laboratories of the company. There is a laboratory in each of the cities near which the farms of the corporation are situated, and it is from these that the milk is distributed.

The farm near New York is typical of others controlled by the company. Here there are 225 cows and each one of them is as carefully considered and cared for as fine horses in the best stables. They are not of any particular strain, but are good grades, the standard being a young, perfectly healtly cow giving an average of ten quarts of milk a day, which tests 41-2 percent or more.

The men, as they go about caring for and milking these cows, look, in their

and being a young, perfectly healthy cow giving an average of ten quarts of milk a day, which tests 4 1-2 percent or more.

The men, as they go about caring for and milking these cows, look, in their white, perfectly clean clothes, like serving men in a well-appointed dining reom. They rise at 4.30 o'clock, and, after brushing each cow and washing the udder, put on their white suits, which are washed each day and then sterilized, and proceed to the milking. The milk is at once put in covered sterilized cans and sent to be cooled and bottled. The room in which this is done has white tiled walls and a coment floor.

The double windows are so arranged that there is no dust, and the daily washing of the walls and floors keeps it scientifically clean. Here the air is changed by an exhaust process, the fresh air being filtered and washed by a spray. The arrangement for cooling milk is so perfect that it requires only about five minutes to reduce it to a very low temperature.

At 6.30 o'clock the milking is finished and the cows are fed, first with grain and then hay. No cow is fed while being milked.

All rations are carefully weighed and brought to the cows; no feed being kept in the barns. When they have finished feeding they are groomed, and if the weather is fine they are turned into the sunning yards which are cleaned daily.

Here, they lie, and chew the cud of full-fed content, or walk quietly about, and, if one may judge by appearance, are altogether as happy a company of cows as could be found in a summer's gearch.

and, if one may judge by appearances, are altogether as happy a company of cows as could be found in a summer's gearch.

The barns are cleaned and swept twice and scrubbed once each day. Although simple, they are models in their way.

The walls, roof and rafters are whitewashed, so that every part, sare the stall divisions and fine cement floors, is perfectly white. Each barn accommodates forty-eight cows, and as the barns are 38 feet wide and 104 feet long this gives 1000 cubic feet of air space to each cow.

A tier of windows forms the upper part of either side. The windows have solid adjustable shutters, so that either the heat or cold can be excluded.

The stanchlons are on a pivot and the cow as she stands in her stall can turn her head to her side at will. Her comfort is further insured by having a drinking cup filled to a certain height by means of a float and so placed that she can conveniently get at it at any time. These stationary cups are cleansed daily and afterward sterilized wish hot steam.

Each stall is provided with a thick soft bed of clean pine shavings, which fill the barns with a sweet, piny odor. As all the refuse matter is removed twice a day and at once put on the land there is no offensive odor about the farm, which at this season of the year, of a truth, Hes smiling in the sun.

The fields, of varying green, are perfectly drained, and along one boundary is a stretch of woodland. Altogether it is a place to inspire the song of a poet and the confidence of a scientist.

Being a little remote from lines of travel, there is no dust, and only distant sounds and the song of birds break the quiet. The water supply is fine and abundant and so carefully protected that contamination is impossible.

Pasturing is no part of the scientific plan on which these farms are con-

be.

Pasturing is no part of the scientific plan on which these farms are conducted. Fodder is raised, cut green and fed at regular intervals and in the proper quantities. As high fertilization and intensive culture are the rule, two large crops are raised each year.

That scientific methods are much better for the cow than unrestricted freedom is evidenced in this herd, where the sleek, shining coars which indicate perfect condition are the rule, in addition to receiving the best food and care a physician examiens the cows

twice each month. No animal is re-tained that is not in perfect condition or after it has reached a certain age. The manager of the farm is a grad-uate of Cornell university. Connected with his office is a small laboratory equipped with apparatus for doing ex-act scientific work.

act scientific work.

It is here that the milk is tested and examined and other work in this line done not only by the superintendent, but by students who come here for practical experience from various colleges.

leges.

While each farm is under the direction of a manager, the entire supervision of all the farms, together with the laboratories, is under the person. I care of the scientific director of the company. In addition to selecting the managers and holding them responsible for enforcing the rules established, in regard to the conduct of everything pertaining to these farms, he from time to time makes a personal investigation of what is being done.

This farming on a large scale and on strictly scientific lines did not spring into being full-fledged, but was gradually developed from the success of a small beginning. After much careful experimenting a milk was produced so nearly germ-free that it was a successful food for babies.

Physicians had found that sterilized and pasteurized milk was not uniformly successful. Also that no form of milk could be used for all young children, but that it should be modified according to the needs of the individual child.

To meet this need and deliver, free from pathogenic germs, the clean milk While each farm is under the

dren, but that it should be modified as cording to the needs of the individual child.

To meet this need and deliver, free from pathogenic germs, the clean milk which has been produced, it was found that a city laboratory was necessary. Here the milk is received and physicians' prescriptions as to the relative amounts of fat sugar and proteids are filled, as druggists fill medical prescriptions, and milk is also sterilized or pasteurized if desired.

The room in which prescriptions are made up has cement floors and walls, and in order to avoid dust is lighted by a skylight. The air is brought in through water and kept in motion by a fan.

The milk, modified, according to the physician's orders, is put up in glass tubes, each one containing the amount to be fed at one time. These tubes are placed in small willow cases like little champagne baskets, and contain as many tubes as are needed to feed the child for twenty-four hours. The little basket cases are sterilized each time they are used and each tube is carefully sealed.

Little children fed on this scienti-

basket cases are sterilized each time they are used and each tube is carefully sealed.

Little children fed on this scientifically produced, modified milk grow healthy and strong. Physicians and their patients become enthusiastic and a fund was raised in a number of cities, that has been made perpetual, to furnish milk modified according to physicians' prescriptions for the alling babies of the poor.

Appreciating the fact that milk produced under scientifically correct conditions contains less than 10,000 germs in each cubic centimetre, while ordinary milk has about 100,000, doctore began to recommend it for other uses. Finding also that it could be kept much longer than ordinary milk, the demand for the whole milk from these farms for shipboard uses and ordinary general purposes has steadily increased. Although the corporation has been constantly adding to the number and size of its farms and enlarging the herds, the demand is and has always been in excess of the supply.

As has been said, the first object of this scientific farming is to produce the best possible milk, Still, the enterprise is conducted on business principles and is a business success.

The net yearly inceme is considered a fair return on the investment. In addition to the fourteen farms controlled by the company in this country, it has three in Canada and one near London, England.—New York Sun.

by the company in this country, it has three in Canada and one near London, England.—New York Sun.

She Consulted the Directory.
In the land where the skyecraper grows a defuure little matron stepped from the sidewalk into a busy drug store and made for the desk where the fat city directory reposea. Sweetly she assured an eager clerk she wanted neither perfume nor soap. She merely wished to consult the directory for half a minute. Then she began to turn the pages.

Enter an irascible old man who wishes to find the address of a man who owes money to him. He stands, waiting, not without show of impatience and a series of suggestive coughs. A business man in a hurry follows. He wants to know where to find the office of a certain firm. It is in the next street, but he has forgotten the exact number. He falls into line. Half a dozen others gradfally swell the line. Still the woman placily turns leaf after leaf, scanning the columns carefully though, apparently, without any idea whether the name she seeks is Brown, Jones, Smith or Walker. The men are fuming, the demure little malden is blissful in her ignorance. Then one of the sufferers determines to end the misery. He offers to assist the woman, intimating his experience in handling the big book may save her time and trouble. Politely, he offers to aid her, and when he asks her what she is looking for, with a little smile of appreciation, she says:

"Oh! It is really so good of you. I am trying to find a really pretty name for my new baby.—New York Press.

DAN GROSVENOR SAYS:

"Pe-ru-na is an Excellent Spring Catarrh Remedy---I am as Well as Ever."
