HOW TO HEAT THE HOME

Local Engineer Gives Some Able Hints on the Subject

The question of how to heat the home is one that is fraught with very great importance and the cause of much anxiety to house builders, says Thomas F. Werts, the heating engineer. Upon the proper decision on this question depends a great deal of the comfort and convenience of the home.

Some years back it was thought quite sufficient to have a number of fireplaces, where wood fires might be burned, and these with the large cook stove in the kitchen provided for heating the house.

As coal came to be used more people naturally turned to the use of surface burning magazine heating stoves, as they not only greatly reduced the labor, but likewise gave a more even temperature on account of warming all the air in the room, but in the natural development people found in the multiplicity of stoves the multiplicity of labor in the carrying of coal and the removal of ashes and some new means was sought, thus the warm air furnace came into use, first by transforming the large cast iron stove into a heater by putting a galvanized iron casing around it and placing it in the cellar with a number of heat pipes distributing the air to the different apartments, until today we have the modern all cast iron warm air heater, which is not only capable of providing heat sufficient to fill a half dozen pipes leading from its dome, but may be of sufficient size to accommodate twenty or more pipes leading to the different apartments.

There are various other methods of heating, such as steam and hot water, but the advantages to be found in the use of a warm air heater in the cellar are so many that students of this subject are more and more turning to warm air as the satisfactory method of warming the home. One of the great advantages to be found in this type of heating is the fact that large volumes of fresh air are drawn in and passed over the heating surface, thus insuring a fresh supply of air constantly. The use of registers, which either set flush with the wall or have a very slight extension, is very much more convenient in the dividing of the furniture. The warm air heater is easily managed and convenient to regulate. As soon as a fire, even though it be only one of shavings or paper, is started in the furnace, you have a distribution of warm air through the house, its volume increasing in proportion to the amount of fire you have. There is no danger from freezing or exposure. All of the heat conductors are concealed in the walls of the house, and by the use of asbestos covering greatly reduce the amount of waste from radiation and cooling.

The installation of proper heating plant is one of great importance and its installation should be looked after by a capable and experienced heating engineer.

The warm air heater is easily managed and convenient to regulate. As soon as a fire, even though it be only one of shavings or paper, is started in the furnace, you have a distribution of warm air through the house, its volume increasing in proportion to the amount of fire you have. There is no danger from freezing or exposure. All of the heat conductors are concealed in the walls of the house, and by the use of asbestos covering greatly reduce the amount of waste from radiation and cooling.

The installation of proper heating plant is one of great importance and its installation should be looked after by a capable and experienced heating engineer.

MARIETTA

The annual outing of the Boys club was held Friday at Accomac, opposite this place, and a very enjoyable time was had. Mrs. Simon B. Cameron, who has charge of the boys, was ably assisted in caring for their pleasure by a number of ladies. Games of all kinds, both on land and water, were indulged in. Those who were present were Geo. Rudisill, Collingwood, N. J., as a guest; and the following from Marietta: Harold Arnold, Raymond Arnold, Paul Arnold, Paul Brenner, Walter Brenner, William Blymyre, Michael Dwyer, Frederick Fryberger, Claude Fryberger, John Houseal, Houston Hanlen, Henry Johnson, Adam Longenecker, Richard Miller, George McElroy, Jr., G. Paulus, Joe T. Rettew, George Shultz, Howard Shaub, Elvin Zuch and Paul Zuch.
The regular monthly meeting of borough council was held in the council chamber on Wednesday evening, and every member was present. President Hipple presided. The street commissioners reported what work they had done in the various wards, and were ordered to make repairs to the streets. The light and fire committees reported everything in good condition. Bills amounting to \$777.10 were ordered paid. The wall beneath the street and the arch at Evans' run, over Second street is in bad condition and was ordered repaired. The wall at the property of Henry S. Rich, was also ordered repaired. The Miller Hardware company was given permission to place a gas tank in the pavement in front of their store.

One-cent letter postage is becoming an acute governmental issue at Washington, according to information just received by Mr. M. T. Williams, of Bond Foundry & Machine Company of Manheim.
Mr. Williams

"FRUIT PACKAGE LAW"
What is Fixed as the Weights of the Different Commodities
Because of his intense interest in horticultural development in Pennsylvania, State Zoologist, H. A. Surface has received at his office in Harrisburg, many questions concerning the so-called "fruit-package law." To answer these he has prepared the following reply giving needed information on the subject:
There is no distinct fruit package law in Pennsylvania, but there is a law applying to all commodities sold in package form, and this is that they must have the quantity of the contents plainly and conspicuously marked on the outside of the package. Chief Sweeney, of the Bureau of Weights and Measures, the Department of Internal Affairs, says:
"If you sell your peaches in a basket the law defines that basket as a container when used for that purpose, therefore, it will be necessary for you to mark the quantity of the contents on the outside of each package.
The law fixes forty-eight pounds as a standard of weight for one bushel of peaches. If your baskets are supposed to contain one half bushel of peaches, then there should be twenty-four pounds in that basket.
If you are not able to put twenty-four pounds in the basket, then mark on the outside of the basket the exact amount contained therein.
The dealer who fails to comply with the requirements of the law, as stated above, subjects himself to the penalties imposed by the act.
It can be seen that the law is not made for the purpose of applying to fruits alone, and consequently is not a fruit package law, although fruits come under the same regulations, in regard to marking packages, as do other commodities. Prosecutions are liable to follow the sale or delivery of short weights or measures.
One person has asked if instead of selling his berries in boxes marked "one quart" he can sell them in boxes marked one pound, which is less than a quart, although they are supposed to contain a full quart. This is legal, for the law does not provide for prosecutions for over measure.
Another has asked if he can make a contract to sell his potatoes by the measured bushel, without regard to weight. This is not legal, for the reason that the law fixes sixty pounds as a bushel of potatoes, and unless the measure contains sixty pounds it is not legal to make a contract permitting it to contain less and call it a bushel.
Another person has asked Professor Surface if it is legal to sell grain or seed in sacks and have the sacks weighed in with the seed, where no other charge is made for them. This is not legal. The weight must represent the net weight of the seed. If the seller wishes to charge an extra price for the sacks this is merely a personal feature of the contract and not a regulation by law. The main point is that if the sale or a stipulated quantity of any material has been agreed upon, the amount delivered must be the net quantity of that commodity, not including the weight of the container, and if any material is put into a package for sale it must be marked on the outside of that package the exact quantity of the material, expressed either in measure or weight. The law fixes the weights of different commodities named in this act as follows:
Alfalfa seed, sixty pounds.
Apples, fifty pounds.
Barley, forty-seven pounds.
Beans, sixty pounds.
Beets, sixty pounds.
Buckwheat, ...

What is Fixed as the Weights of the Different Commodities
