Bamboo is a Dual Service Plant

Nebuchadnezzar has attracted som centuries of curiosity as a grazing numan but he deserves no credit for Bureau of Plant Industry, United States Department of Agriculture, as serts that the natives of the Far East were eating grass in the form o' dible bamboo sprouts long before the

diet. And now the tender sprouts of bamboo prepared for the table in the same manner as asparagus, is dedeclared to be a delicious spring vege

able for American tables. It probably is news to most Amercans to learn that there are several

pamboo plantations of undoubted value already established in Georgia and Louisiana. Bamboo, according (c cientists, is not a tree, but a giant grass. It grows like asparagus, the new plants forming from the origina roots. The bamboo sprout shoots up at the incredible rate of a foot a day, and when mature has a stem 4 inches in diameter and 50 feet high. It r quires no cultivation. The grow

timber has an infinite number of inlustrial uses owing to the light com position of the wood and its long ough fibers. It can be used for barre! oops, ladders, trellises, etc.

It is a valuable crop. In 1912 the eading japanese growers estimate an annual profit of \$50 an acre from the sale of edible sprouts and grows The Bureau of Markets made a re- them as to any further legislation that timber. Present conditions would warrant a much larger profit. An acr of bamboo will produce about 100 edible shoots each spring and wi. continue the production for 40 or 5 ears without being renewed.

More general introduction is urged for the South Atlantic, Gulf, and Southern Pacific States where cond: tions for bamboo culture are favor
