SCALES NEED CLOSE ATTENTION IN WINTER TO PREVENT ERRORS

Users of farm scales are cautioned by the livestock weighing supervisor of the packers and stock yards administration, United States guard against scale trouble in winter and to take precautions to prevent errors in weighing. Scales are often made inaccurate in cold weather by the presence of snow slush, and water which alternately freeze and thaw.

Water may find its way to an out-of-the-way but important scale part where it freezes and alters the scale action. Errors due to such a cause are particularly bad for the reason that they are often large and occur at a time when there is no inclination to study the scale carefully. Inaccuracies may not only be serious, but most of them may remain undiscovered. When the ice melts the cause is removed without a trace and the errors remain unsuspected.

When the user of the scale is on his guard errors from ice can be detected in numerous instances by noting changes in the action of the beam. It may become less sensitive. It may swing quicker, or friction may develop to cause its motion to die down rapidly.

Water, snow, and ice should be kept from the scale proper and from the scale pit, in so far as practicable.
