TELEPHONE CABLES
HIGHLY DEVELOPED
Have Reached Present Excellence as Result of Constant Research and Experimentation

The present telephone cable which is being used more extensively each year by the Bell system has reached its high grade development as a result of researches and experimentation that have been continuous from the early days of the invention of the telephone.

At the present time the underground wire of the Bell system totals some 30,000,000 miles of wire and represents an investment of about \$500,000,000 so that improvements in cable and reduction in the cost of manufacture leads to far reaching results.

Grain Trade Periled
by Railroad Rebates

Serious troubles were encountered by Chicago traders in the early nineties through the practice of accepting railroad rebates. The railroads of the time were keenly aggressive, and they inaugurated a war of cutthroat competition, giving rebates to heavy and regular shippers—a sort of bidding for business. At first the rebates were welcomed by shippers, who were flattered by the thought that they were getting something for nothing. The practice became such an abuse that more than one grain firm faced financial disaster because of it. No one ever knew just how great was the rebate that his competitor obtained and the whole situation added a trade hazard that was immeasurable. The rebates ran from 10 to 25 per cent of the published tariff. It was, of course, difficult for the concern that was able to obtain only 10 per cent rebate to compete with the one that got the 25 per cent reduction. Another phase of the rebate system was that the rebate was merely a sort of "gentlemen's agreement" between the trader and some high official of the railroad. Nothing ever was written about the rebate. The "gentlemen's agreement" sometimes became a disagreement and there was then no way to force the railroad to live up to the understanding.—James A. Patten, in Chicago Daily News.

Enlarged cross sections of telephone cables, showing relative sizes in 1888 and at present. The lower cable, which is the 1927 model, accommodates 2400 wires and is only slightly larger than the upper cable in use in 1888 and accommodating only 100 wires.

From the standpoint of cost it is interesting to note that a cable containing fifty pairs of wires, which was the largest used in 1888, cost about \$155 a mile for each pair of wires in the cable. At the present time cables with 1200 pairs of wires cost in the neighborhood of \$13.00 a mile per pair. While the cost is considerably lower on the modern cable, the present standard cable also contains a much greater number of wires. This permits the new cables to meet more easily the large demands of present day telephone growth.

Many problems in cable construction had to be overcome before the present high grade cables were developed. Proper insulation of the wires, proper covering or sheath, suitable methods for associating the wires and placing them in the sheath all had to be determined and adopted. Early cables consisted of a small number of wires heavily insulated with rubber or cotton and drawn into short lengths of lead pipes. The present paper insulation was unknown. To prevent interference with the transmission of speech in some of the early cables, each wire in the cable was surrounded by an auxiliary cover of lead or tinfoil wound outside the insulating cover. This, of course, made the wires bulky and meant the use of a great amount of raw materials.

An idea of the growing importance of cable today may be obtained from the fact that in 1892, 20,000 miles of telephone wire were added to the underground plant of the Bell system. Last year 3,000,000 miles were added—a hundred and fifty times as much. As time goes on the demands for telephone service will mean that more wire will be required. This wire in the populated centers at least will have to be underground and in cables.

Outside of thickly settled urban sections, the overhead cable is being used more extensively each year. These contain large numbers of wires within a remarkably small space and they are practically proof against the ravages of the wind and storm.

Nature Provides Two Purposes for the Hair

Hair—woman's glory and man's despair—serves man as a preserver of heat and a protective covering and animals as an organ of touch, according to present belief, say Drs. E. W. Croger and F. M. Gastineau in Hygeia Magazine.

The average adult has 120,000 hairs on the head, blondes having more than brunettes because of the finer texture of blond hair. Chemically, dark hair differs from blond in having more carbon and less oxygen and sulphur. The white hair of old age is rich in phosphate of lime. The degree of blondness depends on the color of the hair and eyes and pigmentation of the skin.

The woolly appearance of the hair of the negro is due to the fact that the hair follicle is curved and the hair itself is flat. Asiatic peoples have straight hair, round in appearance and arising from straight hair follicles.

Shoes of Robert Burns

When Robert Burns, the Scottish plowboy, was breaking the soil on his father's farm, he probably did not think that the shoes he then wore would be objects of curiosity 3,000 miles away long after his death.

But the shoes that the great poet wore when a lad are owned by a gentleman who lives in Portland, Maine, and many of the boys of that city have inspected them.

The shoes have wooden soles, which in turn are shod with thin plates of iron. The uppers are tacked to the soles in a rude but strong manner, and the historic footwear is in a good state of preservation.—Philadelphia Inquirer.

Brains and Beauty

Can genius be detected by facial expression? is a question yet to be solved by science. Socrates and Lincoln are notable examples of geniuses whose looks were not in keeping with their brilliant minds. On the other hand, Byron and Shelley were both attractive in appearance, so there is no ground for assuming that mental "beauty" and facial are connected.

One peculiarity of many great men is that their faces are not the same on both sides. This can be tested with a photograph. By covering half of it and then comparing the two parts, two distinct faces will sometimes be revealed.

The Smallest World

From time to time the earth approaches a very little world, one that might be walked around in two or three days, for it is only 85 miles round. This is Eros, the tiny planet whose existence was unknown until 1898, when the astronomer Witt of Berlin discovered it by means of photography.

At intervals of nearly two years our world and this Lilliputian one approaches one another, coming nearer and nearer each time, and last year Eros was nearer to us than it had been for 20 years.

Famous "Blacklist"

Publication of the names of debtors who paid in depreciated currency, during and after the Civil war period was known as the greenback "blacklist." The Pacific coast states conducted trade and other operations on the gold standard. It was considered a breach of faith to buy on a gold basis and pay in paper money, though it was legal tender. The boycott was unknown, but the blacklist was not illegal and the practice of publication was common.
