Youth Quartet of Lancaster county composed of Mark Hess. Naaman ment will be taken against you and Hernley, Richard Lever and Henry the property sold to recover the Metzler sang the following selections: "The Sweetest Story Ever Told," "At Dawning," and "The Lord is My Shepherd." Miss Mary Carolyn Greider, Landisville, played the wedding march and incidental music following the ceremony.

Immediately after the ceremony dinner was served to eighty-five guests, after which the couple left on a wedding trip to Smoky Mountain National Park, Tennessee.

Agricultural Notes

The dairy cow can supply at least one-fifth of the farm family's food

supply. One of the main objectives in growing winter cover crops is to in-

crease soil fertility. Blackstrap molasses is palatable and relished by livestock. It has a mildly laxative effect.

Prices of human hair in China have jumped 50 per cent since the Japanese invasion.

WHEAT STORAGE BINS IMPORTANT

Poor Flooring, Foundation May Spoil Grain.

By E. W. LEHMANN

(Head of Department of Agricultural En-gineering, University of Illinois.) With an almost bumper crop of wheat in prospect, many farmers are planning for extra wheat storage on their farms as a result of a short-

see of warehouse storage space.

The first specification for a good bin is foundation footings large enough to prevent settling-on most soils one square foot of surface bear ing on the ground for every 60 bushels of wheat. Footings need to be wider on soils that are not firm. Depth of foundation should be 12 inches to as much as 36 inches to protect against leaning and undermining by water, rodents and livestock. Fifteen to 18 inches above the ground is a good height for foundations. Small and medium-sized bins are often put on semi-permanent foundations such as of stone or concrete blocks.

Floors and joists should be designed according to tables of weightcarrying capacity (such as found in the U. S. department of agriculture bulletin. Wheat Storage in the Evernormal Granary) and the materials should be free of bad effects and termite damage. Tight floors are necessary to keep in gasses during fumigation.

Concrete floors in bins for longtime storage need to be at least eight inches above the ground with hollow tile or coarse gravel underneath. It is a good plan to cover concrete floors with moisture-proof kraft paper or loose boards or to paint them with two coats of asphaltaluminum paint.

Bin walls can be made of various materials such as boards, plywood, metal or masonry, but must be strong enough to resist bursting pressure. Sometimes added strength is provided by wire or rod crossties. Walls must be tight to keep out moisture and to make fumigation feasible.

Simple Repairs Increase

Farm Tractor Efficiency How to keep tractor power up and fuel costs down gives many a farm-

er a headache. To try to help farmers relieve some of these "headaches," H. P. Bateman and G. M. Petersen, agricultural engineers of the University of Illinois college of agriculture, recently completed some tests on farmers' tractors.

They found that simply resetting the carburetor needle valve on some of the tractors gave a fuel saving of as much as 10 gallons for each 10-hour day. Improper adjustment of the carburetor was the most common-cause found for high fuel consumption.

Adjusting the governor gave as much as a 20 per cent increase in the maximum power of some tractors operating under governor con trol, and more than doubled the power available at rated motor speed under governor control.

Grinding the valves resulted in a third power, yet the fuel consumption was decreased nearly 10 per cent at the same power output in the case of a tractor with the valves in poor repair when brought to the laboratory.

Milk, Natural Greens

Bolster Egg Yield If hot summer weather has caused your birds' appetites to wane, revive them with green feed and milk, L. M. Black, extension poultryman at the New Jersey college of agriculture, Rutgers university, advises flock

owners. "Toward the end of the pro duction year, layers often begin to lose interest in the standard rations," Black says. "Hot weather also tends to reduce feed consumption and lowered egg yields often result. To counteract these effects, wise poultrymen feed supplementary materials to whet their birds' appetites, bolster depleted stores of vitamins and provide protein to stimulate egg pro

"Natural green material is gen erally plentiful during summer and proves a welcome addition to the laying ration. Fresh lawn clippings, swiss chard, cabbage, lettuce and many other garden vegetables-even many varieties of weeds-are excellent,

Combined Straw

Straw left on the field by the combine and plowed under late in the summer for a fall-seeded crop may have detrimental effects, says W. A. Albrecht of the University of Missouri college of agriculture. Straw going back into the soil directly will frequently be injurious to the next crop instead of beneficial. The cases of dangerous effects from straw turned under will increase as the number of combines employed on farms becomes greater.

Wood-Pulp Output in

U. S. Shows Increase Defense Advisory Commissioner Edward R. Stettinius Jr. announced for the first time in 30 years the output of the U. S. wood-pulp industry practically equalled U.S. consump tion and production this year, should hit a record 9,000,000 tons, up 27 per cent from 1939's 7,107,000 tons. Furthermore, if U. S. pulpsters bring old plants into action, they can boost production another 10 or 12 per cent.

Last year the U.S. was the world's No. 1 pulp importer. Of the 2,026,209 tons it imported, more than half came from Scandinavia. The U. S. is still the No. 1 importer, but now it is also the No. 2 world pulp exporter, second only to Canada. The department of commerce cause of loss to the milk supply, announced U. S. pulp exports in and yet it is one of the most simple July hit an all-time high of 65,548 troubles to control.
