Soil Conservation Steps Up Yield 21%

Big Advance Was Made in Last Decade

Looming large among factors contributing to the American farmers' record production job on food and fiber for war is the notable increase shown in acre yields of vital crops.

Per acre yields of major crops during the years 1934-43 were 11.8 per cent greater than yields in the pre-conservation practices decade of 1923-32, according to government figures.

Comparison of acreage and total production figures shows that while total acreage in 1937-43 was about 8 per cent smaller than the 1923-32 average, total agricultural output increased 14.5 per cent.

The 1944 AAA conservation program, emphasizing practices that will immediately increase yields, seeks expansion of the use of lime, phosphate and other fertilizers.

With increased needs for food and fiber expected in 1945, when most of this year's crop will be consumed, U. S. farmers are looking to the Agricultural Conservation program to maintain the land's productivity for the current crop while protecting its fertility for future plantings.

"It also keeps reminding me to meet my production goals."

Fertilizing Tomatoes Nearly Doubles Crop

Two research men of the soils department at the University of Wisconsin, found that tomatoes need a lot of fertilizer and pay a big profit on it, even on land that already is quite fertile.

They report that compared with unfertilized tomatoes the best treatment increased yields enough to net \$24 extra to the acre above fertilizer cost. This was on the basis of the 1943 canner price; actually these tomatoes were sold on the Milwaukee market at a higher price and greater return for the fertilizer.

Most profitable of the fertilizer programs tested was a broadcast application of 500 pounds 6-6-29 to the acre 500 pounds 3-12-12 at the side of the row. At a fertilizer cost of \$20.80 to the acre, this treatment increased yields by 69 per cent.

Row applications alone were not able to bring out top yields and were less profitable on the acre basis.

The 6-6-29 fertilizer which was broadcast gave just as good results as more expensive formulas containing larger amounts of either nitrogen or phosphorus.

These results were secured on a Miami silt loam soil which contains medium to high amounts of phosphorus, a fair amount of potassium, plenty of boron and has a reaction ranging from just below neutral to slightly alkaline.

The variety of tomatoes grown was a rather late one named J. T. D. Berger and Truog think it is possible that an earlier variety would have paid off even better on fertilizer, since about one-third of this crop was caught by frost before it ripened.

Rural Briefs

When the average U. S. civilian gets into the army he consumes three times as much cotton per year in terms of cotton goods as he did as a civilian—75 pounds. In combat he uses several times this 75 pounds.

Soybean acreage has increased 44 per cent since 1941, according to War Food Administration statistics. About 73 per cent of the national soybean crop is grown in the North Central states.
