What you are tomorrow will be the result of your plan today.

Health Hints for Roses

The rose is America's favorite flower. Its beauty, to many, is unsurpassed. Also, unfortunately, is its susceptibility to insects and diseases.

However, to help them grow and thrive, roses require only a few essentials. A good environment, plenty of water and food, and protection against pests will repay you with an abundance of colorful blooms.

Since roses are thirsty plants, they need plenty of water, especially during the hot summer-time. Water helps develop strong, deep-root systems that can withstand periods of drought. Plants should have at least an inch of water each week, whether it's rainfall or supplied with a hose. When watering with a hose, it's best to use a soaker or water-breaker to saturate the earth without wetting the foliage which encourages disease.

Mulching helps produce better roses. A mulch not only reduces moisture loss but also keeps out heat, helps prevent weeds, protects plants from winter injury, and gives the garden a neater appearance. An organic mulch, such as peat moss, disintegrates and gradually improves the condition of the soil.

Roses are heavy feeders. To produce a healthy foliage and abundant blooms, they should be fed several times throughout most of the growing season. However, do not overfeed them — feed only a little at a time. Feed them first in the spring, soon after growth starts. Then space the feedings at monthly intervals up to the middle of August. After this, do not feed until the following spring; any late and tender growth is almost certain to be damaged by cold weather.

For quick results and with the least work, you can feed roses through their leaves (foliar feeding) with a high-concentrate, water-soluble plant food applied with a sprayer. This furnishes easy-to-use nutrients and gives a fast pick-up.

Since roses are subject to attack by many pests and diseases, a spraying or dusting program is of prime importance to their health, says the National Sprayer and Duster Association. A preventive pest control program should start as soon as leaves unfold in the spring.

A multi-purpose insecticide-fungicide rose spray or dust is effective against most pests and diseases that attack roses. It's wise to spray or dust every week throughout the growing season. Whether you choose to spray or dust, always be sure to cover the most important area — the underside of the leaves — as well as the topside. Treat stems, too.

For best control, use a sprayer or duster which makes it easy for you to cover all areas. Choose one with a nozzle adjustable for any direction and on an extension tube so you can easily place the pesticide right where you want. If you use a sprayer, the nozzle should have a cone tip. Spray a fine mist so pesticide envelops all parts of the plant. Avoid spraying or dusting during the heat of the day, or when it's windy. Instead, spray during the cool of the early morning. If you dust, apply it either in the early morning or in the evening when dew helps it stick to the leaves. If rain washes off dust, treat plant again.

A note of caution when you prune the blossoms to adorn your home: leave at least two sets of leaves on the plant stem to promote vigorous future growth. The above suggestions will help you grow beautiful roses — and give you many pleasant gardening hours.

Over The Back Fence

By Max Smith

THE TIME for planning lime and fertilizer applications is at hand and we hope that all gardeners and farmers will utilize the value of a complete soil test before making the investment. Homeowners with their lawns and gardens and commercials may all benefit from this look into the needs of their soils before making any purchases. Early spring is one of the best times to apply either lime or fertilizer to lawns or pastures and much activity will be taking place in another month. When the complete soil test is submitted to the Pennsylvania State soil analysis laboratory, the returns will include recommendations for both lime and fertilizer; this is one of the best guides as to what to use.

LIVESTOCK producers who have permanent pastures or are using some of the winter grains for grazing or green-chopping should keep in mind that an early spring application of fertilizer, especially a nitrogen fertilizer, will bring more and earlier grazing or cutting. Old stands of bluegrass will respond to either nitrogen or a complete fertilizer such as 10-10-10. Winter grains will respond to straight nitrogen fertilizers at the rate of 30 to 50 pounds of actual nitrogen per acre. Some dairymen will

treat part of their permanent pastures early in the spring with nitrogen so that the herd can go on to this area a week or two earlier than on the rest of the field. Straight grass stands will respond to only nitrogen while mixtures of grasses and legumes should have a balanced fertilizer such as 10-10-10.

WHEAT PRODUCERS are reminded of the value of top-dressing their field early in the spring with nitrogen in order to increase their yields of both straw and grain. The amount of actual nitrogen applied will vary with the fertility of the field and the intended crops expected. If the wheat is to be underseeded to legumes then the amount of nitrogen should be kept to not more than 30 pounds per acre; also, if the fertility of the field is good and lodging of the grain is a problem, then little or no nitrogen will be needed. However, on sandy or gravel soils where nitrogen leaching is more severe, and only a good crop of grain is desired, then 40 to 50 pounds of actual nitrogen per acre will usually give good results. Redcoat wheat is especially responsive to extra nitrogen.

SHEEP GROWERS in this area have the practice of allowing their animals to carry their wool too long into the spring; in many cases the flock will have their fleece until early in May. Sheep authorities recommend that the ewes be sheared during March and April for best results; this will not only give a cleaner, high-quality wool clip, but the ewes will be better Mothers without their fleece. Arrangements should soon be made for the custom shearer to come and remove the wool. Growers who are doing their own shearing should be sure the animals are dry and clean when sheared. Wool is one of the two incomes from the flock and some special attention will increase the net returns.

There is this to be said for a world crisis: we learn a lot of geography. The artist and the housewife have this in common — though both can arbitrarily call it quits when they want to, neither can ever with certainty say: there is nothing more to be done.

RUMMAGE SALE

The Women's Association of the Mount Joy Presbyterian church will have a rummage sale in the church basement on Friday, April 19.

828 CROCHETED CENTERPIECE
