Salt in Agriculture. Few persons realize the value of salt in agricultural operations. In large doses it is of course an injury, destroying everything vegetable it comes in contact with. In heavy soil it is also an injury, as the tendency is to make it still heavier, and thus whatever good it might have in one respect is out-weighed by the other. But in light sandy soils, or those elevated tracts of land not wet, but which are liable to become dry in the summer time, it has been found of the greatest benefit, and this chiefly on account of the property it has of absorbing moisture from the earth in dry weather. It is for this as much as for any chemical quality that it proves so beneficial in those cases. Usually wheat does best on rather heavy though not wet lands; but where salt has been used on light soils, as good crops have been gathered as on the most favored heavy soils. In the far Western States, where rain does not fill often, and the danger of crops is chiefly through droughts in the summer-time, salt in light doses ought to prove beneficial; and in the sandy soils of Delaware, Maryland and Virginia, it might be employed to a much greater extent than now with profit. It is chiefly for the moisture it seems to draw from the atmosphere that it is often found of so much good for-asparagus. The asparagns requires an immense deal of water in the make-up of its stalks, though it does not like to grow in wet ground; and this moisture the salt supplies. It has also been found of benefit in raising turnips, beets, cabbage, and other succulent vegetables. But it must not be forgotten that it is an injury in solls already wet or heavy; and therefore, good as it is in many, cases, as indiscriminate use of it will result in disadvantage. In this respect it is like lime and some other things, in which even salt "will not save it."
