

nure on as soon as possible, so that the strength will saturate the soil, and the straw part will become completely rotten before ploughing down; it is also a benefit to the soil by preventing the severe blasts of spring from sweeping the ground, and carrying off much of the valuable gases accumulated there. Do not prepare too much ground, one acre is plenty for the first time, for no man can learn all about it in one year, and yon will find it will pay better to give the same attention to one acre, that most people give to two. Also prepare a bed in the garden for the seed, if possible dig it up, then spread the manure over, and leave it till spring has certainly opened. Then dig it down, and sow the seed very carefully by means of a fine sieve.
